> Oh, I'm sorry. I expected that, since your site is on Usenet, that it would
> carry the groups that discuss Usenet itself - news.*. How foolish of me.

The topic was not whether carrying news.groups is good. It was about the ability to post to groups that may not exist. You make the claim that my software is broken because it will not let me post to a group it thinks is non-existant (and if it is not in the active file, it isn't). I would claim that any posting software that does not stop you from posting to a group that might not exist, and you certainly couldn't read responses from, is broken.

Argue the topic and not some sarcastic clap-trap.

> Please feel free to continue in your ignorance - after all, ignorance is
> bliss, and you certainly appear to want to avoid being unhappy.

And you miss the very next line that says I have since added news.groups. In fact, it is the major point of the next paragraph. Did you 'ignore' that? Are you blissful? Do you feel better fighting an ad-hominum war -- that is what you seem to want. You started it.

> >   I have since added news.groups. It is sort of a waste, don't you
> >think? Since every post here shows up in rec.ham-radio (or is supposed
>
> Adding news.groups wastes *nothing*, as does any crosspost.

Any article appearing in news.groups that is not cross posted uses disk space, on ANY system. Any article appearing in news.groups that is cross posted to comp.sys.amiga or rec.nude DOES waste both space and bandwidth on THIS system, as neither of these groups is carried here.

> The article is neither transmitted twice nor stored twice on disk.

At your site, cross posts are not stored twice on disk. At my site they are. You are making a blanket claim about all sites when I am making specific claims about this one. Unless you know all sites, and can convince me that my site does not behave the way I know it does, you are just plain WRONG. Take a moment and consider that not all sites are the same, and, just maybe, I am correct in saying that discussions re:rec.ham-radio take up twice the space on this system now that I have added news.groups. Would that kill you?

> ...or is this your intent - to torpedo a proposal that you
> obviously dislike in this backhanded manner?

In the same manner you try to torpedo my objections by making false claims about my system when you know nothing anything about it?

If you want to continue the ad-hominum battle you started, take it to mail.

In <vodall@hpfcso.HP.COM (Bill Vodall)> Bill asks:

(Re: Re: 10 meter rig recommendation?)

>Is it illegal to modify a rig to RECEIVE CB?
>
>Is it really illegal to modify a rig to make it capable of transmitting on the
>CB band?   There's no question that it's against the rules to transmit with
>it. Is the mere ownership of a non-type accepted CB rig illegal?

Was this tongue-in-cheek? How many more times will these same questions appear
on the net?

It is not illegal to MODIFY equipment.

It is not illegal to BUILD equipment.

It is not illegal to OWN a receiver.

It is not illegal to OWN a transmitter.

It is not illegal to TEAR UP equipment (presuming it's yours).

a license to do so; or to use transmitting equipment that has not been approved
for the particular service.

It doesn't take a lawyer to figure this out; all it takes is the ability to read
and apply common sense.

In rec.ham-radio, karn@envy..bellcore.com (Phil R. Karn) writes:

>DSP filters can operate over a much wider range of bandwidths than the
>human ear/brain can. In particular, DSP filters can easily achieve bandwidths
>much smaller than the 50 Hz figure that is typical of a trained CW operator.
>This makes it possible for a DSP-based system to demodulate signals that
>aren't even detectible by ear. Examples include N4HY's demodulation of
>4 bps signals from the Soviet "Vega" balloon probe in the atmosphere of
>Venus, and the N4HY/W3IWI DSP moonbounce experiment.

People have been doing moonbounce on CW for years. My impression is that it takes pretty sophisticated (expensive) hardware to approach what a good CW operator can do. Note here I'm talking about speeds near the human optimum (10-30 wpm or so).

>No, there's nothing magic in DSP. Nor is there anything magic about the
>brain/ear combination when it comes to operating as a modem.

Throw in interference in addition to noise, and I bet the human ear can beat anything anyone short of the NSA can build for a halfways-reasonable cost. Those who have never gone beyond barely learning enough CW to pass the 5 wpm test have a misconception of what a "good" operator can do. I have had the experience of visitors to my shack being utterly astounded that I could easily copy a signal that they considered to be completely inaudible due to noise and interference.

>>For sending human-readable text at
>>slow conversational (rag-chew) speeds over narrow bandwidth channels,
>>CW is unmatched. It also has the advantage of simple, inexpensive
>>equipment.

>If by "human-readable text" you mean something that can be decoded
>directly by the human ear/brain without any extra equipment, well, even
>the best CW ops I know still require a receiver and antenna. :-)

By "human-readable", I just meant English-language straight text.
(As opposed to code groups or computer codes.)

>As for CW being the only mode that can use simple, inexpensive equipment,
>it depends on how you define those terms. Packet radio TNCs are fairly
>simple and inexpensive by my standards, inasmuch as they are usually
>smaller and cheaper than most receivers. And given the trends in digital

>vs analog electronics, I expect that the cost-effectiveness of digital
>communications equipment will continue to increase very rapidly.

A complete packet station requires 1) 2-meter (etc.) radio, 2) TNC and 3) computer or terminal. For a garden-variety AT, new synthesized radio and packet-only TNC, we're talking, what $1500-$2000? With a dumb terminal and used radio, it's still in the $300-$500 range. You can get a good-condition Johnson Viking and Heath Mohawk receiver for way (WAY) under $100! :-)

You can also build a nice direct-conversion receiver/transmitter fairly easily. Not too many folks building TNC's and 2M FM rigs from scratch.

>Phil

Indeed, phone operators do slow down their speech when conditions are bad. But CW will still get through when voice communications is impossible.

In a reply to Phil Karn's article commenting on the problems of the protocol choices of the SAREX mission, Jay Maynard replys:

>...in other words, space is for the elite, not J. Random Ham, unless he
>wants to spend limitless bucks on keeping up on the leading edge of
>technology.

The problem with the mission, as I see it, is that this was also not for J. Random Ham, but for the stations with the power and large antennas to break the pileup enough times to complete the entire protocol dance in the limited time.

Given these requirements, a non-connected sequence could have been created that reduced the number of required successes, making it more likely that the random ham would have been able to work the shuttle.

>I agree with you about this one. That we didn't hook up with MIR counts as
>a major disappointment, even more so than the fact that I wasn't heard by
>the robot. :-)

I was also disappointed that the contact with MIR didn't happen.

I was heard by the robot, and got UA frames back, but never a sequence number or disconnect. (I would have believed the publicity that said a number was good enough, and quit trying then.)

As for the related point of the rotten SSB quality to the mideast, I think part of the blame for that goes to current transceivers, which really mangle the audio. I have been told that old phasing transceivers existed that had very nice SSB audio, but I have never been fortunate enough to hear them. It may be unfair to berate the modulation method when we use it so poorly.

I have used an ST-6 for old-fashioned RTTY years ago. The TTY machine would be down to essentially zero copy with a signal that would still be nearly 100% copy by ear on CW. Of course, AMTOR has error-correction, but it still has to have a mostly-correct signal for the error-correction to work.

hello I'm back with a still deeper unwinding of Alinco'
s mystry.

A while ago someone asked what does the ADD button do on the rig. I checked and found that it did nothing . . . hmmmmm

well it has one function that is useless in that it changes the bandscan function. (when used as intended).

Here is how to make it sing!

The 590 has 2 band limit memory sets 1L & 1U and 2L and 2U.

The ADD function will allow the scanning of one band limit and then the other.
Acording to the instructions the 2L & 2U pair are for 440....not true!

Example.

Enter the lowest 145Mhz repeter frequency into 1L. (see the repeter directory)
Enter the highest 145Mhz repeter frequency into 1U.
Enter the lowest 146Mhz repeter frequency into 2L.
Enter the highest 147Mhz (they run together) repeter frequency in 2U.

press F then ADD (ADD will be indicated on the display)
now initiate band scan.

the rig will now scan as follows

```
1L frequency ----> 2L frequency  ----skip----  2L frequency ---> 2U frequency
  ^                                                                  |
  |                                                                  |
   <-------------<------------<-----------<----------<---------<-----
```

Now if you couple this with the automatic offset selection that i outlined earlier you can scan ALL the repeter frequencies with out going through the simplex/cw/ssb/etc frequencies. A real neat feature when travling out of state!!!!

Be very careful here. The KA9Q NOS software assumes that each of the tasks are run to completion, and are *NOT* timesliced. When I did the port of the NOS code to the Amiga, I investigated scrapping much of the tasking package used in NOS, and using native Amiga processes (after all, it is a multi tasking operating system on the Amiga). The problem is that there are not synchronization primitives to protect against a NOS task being interrupted before it voluntarily gives up control.

In the end, I continued to use the NOS tasker, and just ran it all as one Amiga process.

Please Note:

The document "Understanding Solar Terrestrial Reports" was distributed over the nets earlier this week. It is hoped that those of you who requested the document received it without too many problems. If any of you failed to receive the document, you may request it from "std_oler@hg.uleth.ca". If you are unable to establish contact using this address, or if you fail to receive a reply after one week, try resending the request or locate someone who has already obtained the document. There have been some problems in getting mail from hg.uleth.ca to some of those people who have requested information.

Also, if any of you have placed the document on an anonymous FTP site, please notify std_oler@hg.uleth.ca. A public note may also be appreciated by those who have been unable to obtain the document through other routes.

--- SOLAR TERRESTRIAL FORECAST AND REVIEW ---
December 16 to December 25, 1990

Report Based In-Part from Data Obtained from the
Space Environment Services Center
Boulder Colorado

SOLAR TERRESTRIAL REVIEW FOR 09 DECEMBER TO 15 DECEMBER.

Flare activity this week was significantly enhanced. Four major flares occurred in three days. Not since early May has more frequent major flaring been observed. The major flaring began with the eruption of a class M5.8/2B flare from Region 6398 at 07:54 UT on 10 December. This flare was significant in that strong Type II and IV radio sweeps were observed during this flare. The Type II shock speed was estimated at 1400 km/second. The interplanetary shockwave from this flare was not as significant as was first expected, but it did produce minor geomagnetic storming over high latitudes and active conditions over most middle latitudes. A sudden magnetic impulse was observed near 21:46 UT on 12 December, corresponding to the impact of the shockwave. Radio propagation conditions immediately degenerated to poor levels over high latitudes and fair to poor levels over middle and some low latitudes. Increased signal flutter, absorption, noise, and distortion as well as increased geomagnetic and auroral activity were observed for the following 12 to 15 hours. Conditions quickly improved, however, to near-normal levels approximately 18 to 24 hours after the flare effects hit and have remained at near normal levels since then.

The second major flare occurred from Region 6402 at 20:52 UT on 11 December. This flare was rated a class M6.5 x-ray flare, but only attained a very small SB (brilliant subflare) optical class. This flare was accompanied by only weak discrete radio bursts. The most severe terrestrial impact produced by this flare was a moderate intensity, moderate-duration SID/SWF which affected short wave frequencies up to 13 MHz for about 70 minutes over the sunlit portions of the earth.

The third major flare was rated a class M5.1 x-ray flare. Like the second flare, this third flare was optically weak. At its peak intensity, it was rated only a meager SF (faint subflare) optical class. The flare originated from Region 6398 at 08:03 UT on 12 December. It's only terrestrial effect was a SID/SWF.

The final major flare of the week occurred from Region 6398 on 12 December and was the most significant x-ray flare of the week. This flare attained a class M8.9 x-ray intensity at 14:10 UT, but like the other flares, only attained a weak faint sublare optical intensity. The duration of this flare was a respectable 71 minutes and was associated with a moderate intensity, moderate duration SID/SWF. This was the only significant terrestrial impact observed from this flare.

The cluster of regions which produced this weeks activity quickly rotated out of view between 12 December and 14 December. Their disappearance produced a steep decrease in the solar flux. By 14 December, the solar flux had dropped 32 points from 236 on 12 December to 204 on 14 December. This cluster of sunspot activity will begin to return near 26/27 December. Models currently suggest that the active sunspot forming regions will likely remain intact during their transit on the far side of the sun, but magnetic complexity and flaring is expected to drop before it returns near 26/27 December, barring any new developments of complex active regions in that area. M-class flaring will probably still be possible, but major flaring is not too likely. If the models are correct, a moderate to strong increase in the solar flux should accompany the return of these regions back into view between 26 and 28 December.

Since the disappearance of the active regions beyond the west limb, attention has been focused primarily on Region 6410 and 6412. Region 6410 had exhibited significant growth and increased flaring earlier this week, but has since shown signs of slight decay and decreased flare output. This region will probably begin a more rapid decay within the next 2 to 4 days. Region 6412 (which was old Region 6368 on its last rotation) is the largest system on the solar disk at the present time. It has retained a relatively complex configuration capable of producing M-class flares. A total of 45 spots are encompassed in this region, which covers an area of near 4,230 million square kilometers (1,650 million square miles). Although old Region 6368 was associated with several magnetically complex areas within it's boundary, it has degenerated and presently consists only of a type Beta magnetic configuration.

In all, there were over 17 M-class flares this week, almost all attributed to the active cluster of regions which were in the northwest solar quadrant before rotating out of view this week. Of the regions which were active, Region 6398 was the most active, producing near 50% of the flare activity observed this week. About 40% of the remaining activity was attributed to Region 6399 which showed a dramatic and intensive burst of M-class flaring on 12 December. The remaining 10% was shared by the other less-active regions on the solar disk.

This week was full of SID/SWF's. At least 14 SID/SWF's were suspected this week due to the solar flaring. Short-wave radio experienced frequent periods of degraded signal quality during these SWF periods.

No significant proton enhancements were observed, despite the increased solar activity. However, the background X-ray flux increased notably during the week to levels near class C2.1. It has since declined to levels near B9.1.

SHORT TERM SOLAR TERRESTRIAL FORECAST

Solar activity is expected to remain mostly low to moderate over the coming week. The most active regions currently on the solar disk are just passing the central meridian as of 16/17 December and will begin rotating out of view near 22 December. Region 6412, which is the most significant easterly region, will rotate out of view around mid-day on 24 December. Although M-class flaring is possible from Region 6412, no significant major flaring or increases in activity are expected, barring the appearance of any new major active centers.

Geomagnetic activity is expected to remain mostly quiet to unsettled this week. Auroral activity will likewise remain quiet and not visible. HF radio propagation conditions are expected to be normal this week, but with an increased risk for SWF's during the local daylight hours. VHF will remain normal this week with no significant opportunities for DX expected. The MUF has decreased by about 10 MHz since the early part of this week, and is expected to decrease further as the week progresses. However, widespread openings on 10 meters should remain possible throughout this week. No significant openings are expected above 50 MHz.

SUMMARY OF ALL ACTIVE REGIONS VISIBLE ON THE SOLAR DISK AS OF 17 DECEMBER

Region #	Location	LO	Area	Class	LL	Spots	Magnetic Type
6405	S16W73	103	0000	AXX	00	001	ALPHA
6409	N27W24	054	0060	HRX	01	002	ALPHA
6410	N05W18	048	1320	EAO	15	027	BETA
6412	N17E10	020	4230	FKI	18	045	BETA
6413	N23W03	033	0060	HRX	01	003	ALPHA
6415	N10W05	035	0090	CAO	04	007	BETA
6416	S06E22	008	0060	DRO	03	005	BETA

NOTES: Area is in million square kilometers. Angular extent (LL) and solar longitude (LO) are in degree's. For more information regarding the terminology used above, request the Glossary of Solar Terrestrial Terms from: "std_oler@hg.uleth.ca".

H-ALPHA PLAGES WITHOUT SPOTS. LOCATIONS VALID AS OF 24:00 UT ON 16 DECEMBER.

REGION	LOCATION	LO	COMMENTS (IF ANY)
6406	S27W71	101	NONE
6411	S24W27	057	

ACTIVE REGIONS DUE TO RETURN BETWEEN 17 AND 19 DECEMBER

Region	Latitude	Longitude (Helio.)
6394	N06	287

NOTES:

This graph ONLY depicts geomagnetic conditions observed at Boulder, Colorado for the past 87 hours. Conditions to the north of Boulder will generally have slightly higher activity than Boulder, while conditions to the south of Boulder will likely have lower activity than those depicted here. However, the plots should present a good approximate average of planetary geomagnetic conditions.

For information regarding the interpretation and/or use of these charts, send a request for the document "Understanding Solar Terrestrial Reports" to: std_oler@hg.uleth.ca.

NOTES:

Predicted geomagnetic activity is based heavily on recurrent phenomena. Transient energetic solar events cannot be predicted reliably over periods in excess of several days. Hence, there may be some deviations from the predictions due to the unpredictable transient solar component.

NOTES:

These VHF DX prediction charts are defined for the 50 MHz to 220 MHz bands. They are based primarily on phenomena which can affect VHF DX propagation globally. They should be used only as a guide to potential DX conditions on VHF bands. Latitudinal boundaries are the same as those for the HF predictions charts. For more information, request the document "Understanding Solar Terrestrial Reports" from: "std_oler@hg.uleth.ca".

>

Right now only CW OP's are blown off by big sigs on 28.005,15,30 and 45 with great regularity. This weekend I was having a nice QSO with a GM in the morning when a horendous LSB station came on 28.015 with a reverb mike that sounded like the voice of GOD commanding HIS children. Then these two CB'ers started arguing about the best way to cook curried chicken. They wasted at least 10Kc of spectrum with their culinary discussion. As usual I moved off and tried to find the GM but he was probably too disgusted to continue.

For the moment this sort of thing is unknown to phone only people but I have begun to hear illegals creeping into the upper and lower portions of other bands as well. It won't be long before there will be no Amateur Radio to be enjoyed by the new no-coders with their hard earned priviledges.

A message to all who want to be able to enjoy the hobby in the future:

FIGHT LIKE HELL TO KEEP THE 30 METER BAND AND DIE IF NECESSARY TO KEEP IT CW ONLY.

A message to the more virulent no-coders out there:

IF WE GIVE YOU ALL OF THE REST OF THE SPECTRUM FOR NOTHING...WILL YOU LEAVE US ALONE ON 30 METERS?

Thank you all in advance for your civility, friendliness and patience.....

AA6PN

Somehow, a line got lost in my message. I've included it in brackets below:

In <vodall@hpfcso.HP.COM (Bill Vodall)> Bill asks:

(Re: Re: 10 meter rig recommendation?)

>Is it illegal to modify a rig to RECEIVE CB?
>
>Is it really illegal to modify a rig to make it capable of transmitting on the CB band?   There's no question that it's against the rules to transmit with it. Is the mere ownership of a non-type accepted CB rig illegal?

Was this tongue-in-cheek? How many more times will these same questions appear on the net?

It is not illegal to MODIFY equipment.

It is not illegal to BUILD equipment.

It is not illegal to OWN a receiver.

It is not illegal to OWN a transmitter.

It is not illegal to TEAR UP equipment (presuming it's yours).

[It is ILLEGAL to transmit on a frequency or band for which you do not have] a license to do so; or to use transmitting equipment that has not been approved for the particular service.

It doesn't take a lawyer to figure this out; all it takes is the ability to read and apply common sense.

73,
Dube   N5PDK

> all of the legal requirements for CB emissions?

That's true now. The hangup is the FCC wants proof that it meets the specs.
Hence, certification of type acceptance.

> Also, is it legal to modify a CB to operate on 10 meter ham?

Yes, but it is NOT legal to convert it back again.

Chill out. Some of us pay for our line charges and connect time ourselves
rather than freloading on the taxpayers or an employer. Moreover, some of us
have as little as ten megs total disk space. Such folk are seldom inclined to
import any newsgroups they don't have a passionate interest in.

The only way to "gloss" the finish to
it's original finish is to repaint.
You can, however, use Armorall (spelling?).
It's the stuff that you put on your dash
and tires on your car. Turtle Wax also
makes a similar product. You have to
repeat the treatment every 2 or 3 months
to keep it looking good.

Try ELI Heffron and Sons in Cambridge (138 Hampshire (I think)).  They have
all sorts of components, computer bits, test equipment and similar stuff.
Not that much audio gear, but you never know what you may find.

Yep, I think this one is more interesting than the pizza wars. :-)
I'd like to hear some comments on scratch built VHF+ radios. Personally,
I would take a look at the kits put out by Hamtronics and Ramsey. They
are inexpensive and at least the new Hamtronics stuff works really well.
I haven't actually seen one of the new Ramsey 2 meter symthesized tranceiver
kits, but it sounds good in the ad. Circuit layout is not trivial at VHF+
and having a proven circuit board as a starting point is a big help.

If you really want to scratch build a proven design, check out "VHF-UHF Manual" by Evans and Jessop. This is an RSGB publication that has detailed designs for 2 meter transmit and receive strips that look fairly easy to build. The "Manual" is available from the Ham Radio Bookstore. This book is highly recomended for the bookshelf of any RF hacker.

I wonder with all of the recent changes (technician and disability waiver) if the FCC has really gone far enough ?

1. Wouldn't it have been nice to see the FCC change the requirements for elements 1B and 1C to something like the following:

   1A code @ 5WPM
   1B computer operations (basic understanding)
   1C computer   "   and theory (advanced)

2. The above would have conformed to the ITU regs and it would also have eliminated the need for the code waiver for the handicapped.

3. More important though it would help to a large degree advance the state of the skills used in the hobby and may have encouraged even more young computer oriented people to jump in.

4. RM ---- xxxxxx (do I hear a request for rule making)

It was an award for "Excellence" in contributing to the war-effort.

"Rah-rah"??? Do I detect a little cynicism here? As a kid, I collected milkweed pods for fliers' life jackets, collected rubber and scrap metal, and bought War bonds and savings stamps.

I also watched my church's service flag stars turn from blue to gold one by one and wondering if the 3rd star in the fourth row (my brother's) was someday going to be one of them. My brother's star stayed blue, but 8 out of 34 didn't.

So, my friend, be careful how you speak of a time when people still cared about more than their own amusement. "Rah-rah", indeed. [:-(

Amen!

For one thing, I think it will have a very positive influence at the
college/university level.  I know in my experience with the ARC here
```

at Clemson, we have always had trouble getting students to worry about code AND theory when there was other unimportant thing taking up their time (like classes, homework, projects, football games, etc). It was always the code practice that seemed to be the thing that made people give up... the theory was never that difficult.

Now, with the code out of the way, they will be able to get a license and experience what ham radio has to offer. Then, hopefully, when the time and resources match the expectations, there will be enough good feelings about ham radio as a whole for them to want to learn code. It's almost like selling software... you have to show a demo, and let people try it for themselves. Perhaps this new no-code license will let people try ham radio and see what it has to offer.

And if all they see are a bunch of other hams expecting them to be a bunch of lids, well....

I wonder if someone could advise me on the feasability of using shortwave to communicate with a friend of mine whilst he is working at sea.

He will probably be sailing out of Japan to Brueni (sp?).

Is it possible to reach that part of the world from the UK ?
At all ? Regularly ? If so, what sort of kit would be best
(which band, output power etc.).

I am new to the world of shortwave broadcasting so please
keep the TLA's to a minimum.
Many thanks.

This is a most 'wonderful' way of welcoming the new-commers to ham radio.
Perhaps we should insist that they sit in the back at club meetings, that
is if we let them in the meeting in the first place. Pray tell what is
wrong with the name TECHNICIAN? What is so great about element 1A that
makes the person that passed it better than one that did not? It is
stupid, bigoted atitudes like this that turn people off on the hobby.

you can get a used rock-bound HR-2B for $30, a HD4040 for $30 and use that
VIC20 with a homemade terminal program that you just had laying around!
Looks like about $60 to me.
You don't NEED to spend money on new stuff for packet or any other mode.

Oops. You forgot the cost of the Kilowatt amplifier and the rack of antennas. The DSP moonbounce experiment required far less EIRP than your typical CW bounce station. Frankly, a used PC with a DSP board is less than half the cost of a used KW.

> Throw in interference in addition to noise, and I bet the human ear can beat anything anyone short of the NSA can build for a halfways-reasonable cost.

As a matter of fact, spread spectrum techniques do far better against "interference" than noise. I can build SS systems for a normal SSB rig that you'd have one heck of a time detecting with the naked ear (and given the data rates, they'd be very cheap).

> Those who have never gone beyond barely learning enough CW to pass the 5 wpm test have a misconception of what a "good" operator can do.

Phil, Bob and myself are all beyond the 5 WPM stage.

> I have had the experience of visitors to my shack being utterly astounded that I could easily copy a signal that they considered to be completely inaudible due to noise and interference.

I've had similar experiences on sideband. "How did you hear that"? Yeah, I'll take a well trained op any day over your typical 2m jawjammer, but I know I'll never be as good as the machines.

> A complete packet station requires 1) 2-meter (etc.) radio, 2) TNC and 3) computer or terminal. For a garden-variety AT, new synthesized radio and packet-only TNC, we're talking, what $1500-$2000? With a dumb terminal and used radio, it's still in the $300-$500 range. You can get a good-condition Johnson Viking and Heath Mohawk receiver for way (WAY) under $100! :-)

An interesting Apples - Oranges comparison. Comparing new equipment to used. And an AT at that -- which can be used for far more useful purposes than the Viking.

A used TNC can be had for about $50. A used rockbound VHF radio can be had for $30. A used terminal can be found for $20. $100.

>etc (NOT just in yakking on 2 FM) are planning to get their Tech
>come February 15?

You will be surprised, Tad, at how much latent interest there is in Ham radio around the hi-tech spots, with Morse code being the main hinderance up till now.

A colleague who was studying Morse has now stopped and is simply waiting for February to roll around. A friend in another company who tried hard and gave up on Morse about a year ago has asked me to wake him as soon as an exam session is available. These are EEs who are as likely to homebrew as they are to yakking on 2m with a storebought HT. Hey, these guys think the written tests are at best a joke :-) It was situations like these that made me get off my buns and write in to the FCC earlier (never lobbied any govermental organization, for any cause, *ever,* before that).

There are also those who are more likely to just yak on 2m. A tech in my group now wants a license (and he had to do Morse in the Navy - but swore never to touch the key again). A project manager whose XYL is a Ham now wants his license.

A portion of these folks will eventually learn Morse for the fun of it or to be able to get on HF. Both the EEs have confessed that to me. Technical folks who work with multi-megabit-per-second data links in their daily work activity are sometimes too proud to *have* to learn a mode of communications where you manually micro-manage the makes and breaks of electrical contacts.

Is it unlawful to modify a ham rig to receive CB? I think not .....
The 11 meter band is available on many ham rigs with general coverage
receivers. ie : 0-30Mhz Icoms, Kenwoods, Yaesu do not block 27-28 Mhz.

As pointed out by others, transmitters for CB require type acceptance
certificates.

Decided I was not done. By the way what is your license class? I see you
did not sign your note with you call. Perhaps you are only a TECHNICIAN.
In that case I am better than you and get to sit in the front. I have
a Extra class license. Guess what, I passed element 1c, but I will call
them TECHNICIANS or TECH for short. As many people have pointed out and
it is quite true, 98% of this hobby can be enjoyed WITHOUT knowledge of
CW, so why adopt a better-than-thou attitude because someone did not

demonstrate a barely literate ability of CW? And that is about it.

THEY ARE TECHNICIANS - PERIOD!

Are we going to discriminate against the present techs because they did
not pass the old general exam? Thay has never been a point of discussion.

Then again it depends on your definition of DX. I consider Chicago to
be DX, on 2304, of course.

Rich, thats not the central issue, CW is FINE for HF DXing, it's even required
for keeping microwave work simple and practical. I don't see what you are
complaining about, the HF bands will see NO CHANGE from this!!!!
Unless some of the new Techs DARE to invade your bands after learning the
code from (oh my GOD!!) tapes.
The upgrade path hasn't changed, to get use of the majority of HF privs,
you will continue to need 2,3a,3b and at least 1b.
To get ANY HF privs you still need to pass 1a!! You should be thrilled,
the VHF/UHF/micro group should be thrilled as they can bring in technically
competant people to all upper bands right away.
I mean, I do think parts of the new legislation are silly (like this valid forever
CSCE stuff for 1a) but hey thats life.
The worst part about this nocode liscence is that it has turned most of those

```
hold present (read:CW required) liscences into raving, argueing, crying LIDS.
(Come to think of it, I've just added fuel to the fire, boy can I screw up:-)

It's interesting that before the war (sometime around 1937) the War Ministary
(British) requested the RSGB not to publish letters in "Radio Communication"
regarding interference on 10 metres.  The "Chain Home" RDF (later RADAR)
operated around 30 MHz!

The "woodpecker's" grandfather was Watson Watt!!

The 12 pounds is not that bad (about the same as my Aussie licence) and
with a UK licence you can operate throughout Europe (CEPT countries) when
you visit.  What kills me is that I end up paying about twice that rate
because the banks charge so much for the international bank draft!
When I was in Oz the bank charged about $3, here in the US its more than $20!
Does anyone know a better way to do it?  Is it possible to do GIRO transfers
from a US Bank? Is it cheaper?

>It is not illegal to MODIFY equipment.
See below.
>It is not illegal to BUILD equipment.
For just about any other service, yes it is.
>It is not illegal to OWN a receiver.
For cellular phone without a service contract? Yes it is!
For 10.525/24 GHz in Ct, Va, and Dc, yes it is!
>It is not illegal to OWN a transmitter.
>It is not illegal to TEAR UP equipment (presuming it's yours).
>
>It doesn't take a lawyer to figure this out; all it takes is the ability to read
>and apply common sense.

Perhaps you should apply a bit of your own wisdom to yourself.

Regarding the CB service and modifying radios:

Title 47, Part 95

95.425 (CB Rule 25) May I make any changes to my CB station transmitter?

(a) You must not make or have any one else make any internal modification
to your CB transmitter.

further:

95.424 (CB rule 24) How do I have my CB station transmitter serviced?

(b) ... internal repairs or internal adjustments should be performed by
or under the immediate supervision and responsibility of a person
certified as technically qualified to perform transmitter maintenance
and repair duties in the private land mobile services and fixed services
by an organization or committee representative of users in those services.

For the Private land mobile radio services:

90.427 Precautions against unauthorized operation.

(b) ... no person shall program into a transmitter frequencies for which
the licensee using the transmitter is not authorized.

For the Aviation services:

```
87.73 Transmitter adjustments and tests.
      A general radiotelephone operator must directly supervise and be
      responsible for all transmitter adjustments or tests during install-
      ation, servicing, or maintenance of a radio station. A general radio-
      telephone operator must be responsible for the proper functioning of the
      station equipment.

I have read parts 0-19 and 80-97 exhaustively. I don't claim to remember
everything I've read, but I sure remember that your above generalizations
are not always true.  The above references were gleaned from the regs by
quickly glancing at the indexes of the individual parts.  Please read the
regs for other services before you arrogantly generalize and patronize other
readers of rec.ham-radio.

Sure!  When both paddles are squeezed, the keyer will make a repeating
di-dah-di-dah-di-dah, etc.  If the paddle are simultaneously released
during a dah, a di will be inserted.  If the paddles are simultaneously
released during a di, a dah will be added.  This is "B" timing.

I'm looking for a logging package (running on an IBM PC compatible) which I can use in DXing and contesting, both in the VHF and HF bands. I'd like something which has:

- user defined dupe check rules (with easy exit if a dupe is hit)
- screen layout which is easy to work with
- user defined fields
- easy/flexible searching and reporting
- good documentation
- QSO notes (lots)
- control of some input by rig (not mandatory but nice)
- data import/export
- use of mouse (nice but not required)
- public domain nice but commercial OK too.

Has anyone had experience with a package which has some or all of these features? What do you like/dislike about the package? Any recommendations?

I saw an ad in the July 1990 QST for the Logic (as opposed to Logic Jr.) package from Personal Database Applications in Duluth, GA. Any opinions on this one?

All advise would be greatly appreciated.

Why worry about fuel for the fire when it is true? Unless of course someone
misplaced your asbestos underware, and they are about to put you on a hot-seat like that poor guy in the 60's horror flick "Mark of the Devil".

I probably missed this answer, but here goes anyway. Are the 55 questions for the codeless tech going to be based on the current Novice/Tech question pool????

thanks and 73s....trop (Troy)

Uhhhh....I thought the FCC stopped issuing the General Radiotelephone License. Didn't they deregulate all this? And what does this license have to do with type acceptance? I didn't mean that they derregulated the process of type acceptance, but I thought that the license was discontinued.

>We're here to help you!

Yeah, we gotta teach them the proper techniques for repeater wars, jamming, endless discussions about traffic and the weather, how to properly take an hour to describe your HT, how to set up worthless "traffic nets" and the like. If we approach the new hams with the attitude that we've gotta teach them the ropes as if they are somewhat inferior, we'll be the losers.

I suspect that we'll be the ones to learn from the newcommers. Assuming that we gently discourage the 11 meter/HF operating practices, we might just learn a few things about using ham radio. I know that the people I've been recruiting are the elite of the computer and commercial RF industries. These are the people who have enough self-respect NOT to submit to the CW initiation and instead have waited until the ham radio rules gained some sanity. We've made that first important step. We have some more to do before we achieve the ultimate goal - the total elimination of CW as a licensing requirement but this is a start.

I think we'll be pleasantly surprised with the results of this change. I can hardly wait to see what happens.

Probably the biggest incentive for my posting was the bold printed, red
warning sign that came with my Uniden 2510 10meter rig. They threatened
that if I ever modified my rig (added the jumper that enables CB) and returned
it for repair, not only would they not repair the radio but they would also
notify the FCC.

This bothers me. It's assumed that since I can use the radio on CB, I'm using
the radio as a transmitter and have done something wrong.

> Luigi Giasi, KA1UTU, President of W2SZ the getting larger ARC of RPI

Don't get too excited. The code "barrier" hasn't "fallen" it's only
been moved back a significant amount.

But there's no going back now. For better or for worse, the requirement
has changed. It's somewhat ironic that the "self-policing" ham community
which has never had enforcement power will now be dealing with changes of
a large scale when the FCC has no police power either due to budget
limitations. Maybe there won't be any problems. Hope not. If there

are, it might be the excuse required to eliminate the ham bands and turn over the frequencies to cellular services.

But, as always, abusing new hams won't help a thing. Welcoming them is as much as we can do.

Welcome no-code hams!

(Just don't complain about "those funny beeps" on the repeater too often :-)

As someone who's seriously considering becomming a ham in the next few months (thank the FCC for doing something *right* and not putting the nocode above 220), I must thank all of you folks for being so warm and positive and supportive and making us potential hams feel very welcome. I can see why the hobby is losing people.

Be wary of self-fulfilling prophecies -- if you are antagonistic and obnoxious to the new and potential members, you'll scare off all but the stubborn (like me) or the antagonistic or obnoxious. No code is here. You can either pull together and make it work by bringing in the people you want, or you can scream and moan and bitch and complain and scare away everyone except the ones you're most worried about -- because they won't care what you think.

It's very literally up to you. If No code screws up, it won't be the FCC's fault. It'll be the fault of the people who decided it was no good from the beginning and worked to make it fail. You can either bring in the people that make amateur a good hobby and teach them to be good hams, or you can sit back and watch the idiots take over. Now's an important time for everyone concerned to get together and decide to do it right.

You're either part of the solution or part of the problem. It's the ground floor. Is your elevator going up? Or out?

```

I won't speak for Brian but I'll speak for myself.

I agree with Brian. The FCC couldn't give a tinkers' dam about whether or not some Tech on 10M has passed the code test, unless somebody causes trouble. They're sick of bellyaching oldtime hams.

Apparently Dube wanted to hear it from an Extra.

A quick note that was inadvertently omitted from the previous note. The U.S.T.R. document which is available for anonymous FTP at nic.funet.fi, can be found using the following directory path:

        "pub/misc/rec.radio.shortwave/solarreports/report.info"

The reports, alerts and warnings which are posted may also be found at this site in the directory:

"pub/misc/rec.radio.shortwave/solarreports"

Please use these directories when FTPing the desired material. The "solarreports" directory presently contains the following files:

```
total 115
-rw-rw-r--  1 huopio   ftp          722 Dec 10 13:41 README.REPORTS
-rw-rw-r--  1 huopio   ftp         4570 Dec  7 00:52 msfa0412
-rw-rw-r--  1 huopio   ftp        17041 Dec 11 13:05 msfa1112
-rw-rw-r--  1 huopio   ftp        17645 Dec 12 14:47 msfa1212
-rw-rw-r--  1 huopio   ftp        18180 Dec 13 13:57 msfa1312
drwxrwxr-x  2 huopio   ftp          512 Dec 17 17:29 report.info
-rw-rw-r--  1 huopio   ftp        27180 Dec 10 13:40 stfr1012
-rw-rw-r--  1 huopio   ftp        27802 Dec 18 13:57 stfr1812
```

The files are coded as follows:

<report type>DDMM , where

<report type> can be	msfa	(Major Solar Flare Warning)
	mstr	(Monthly Solar Terrestial Review)
	gsa	(Geomagtnetic Storm Alert)
	stfr	(Solar Terrestial Forecast and Review)
	pmfw	(Potential Major Flare Warning)

DDMM   means the day and month of the report/article submission.

The directory containing the U.S.T.R. document as well as the Glossary of Solar Terrestrial Terms, may be found in the "report.info" subdirectory. This directory currently consists of the following:

```
total 348
-rw-rw-r--  1 huopio   ftp         5792 Dec 17 17:27 contents.txt
-rw-rw-r--  1 huopio   ftp        93201 Dec 17 17:29 docpack.lzh
-rw-rw-r--  1 huopio   ftp       155831 Dec 17 17:26 part1.doc
-rw-rw-r--  1 huopio   ftp        61155 Dec 17 17:27 part2.doc
-rw-rw-r--  1 huopio   ftp        21898 Dec 17 17:27 solarterm.doc
```

(docpack.lzh is a LHARC archive file of the documents.)

Many thanks to Kauto Huopio (OH5LFM, huopio.lut.fi) for his efforts in establishing a base FTP site for this information, and for his efforts in redistributing the data to other various nets of interest. His efforts are appreciated.

Just remember that most CB practice is the way it is because the status quo for CB is *different* than ham communications. So if you hear 'CBisms' on 2m, you might ought call the new ham (on the phone -- don't embarass the ex-CBer by calling him a lid on the local repeater!) and *gently* inform him/her that CB lingo is looked up as poor practice (due to its "uneducated" nature).
Hard feelings of amateurs towards CBers are also due CB's takeover of the 11 meter amateur band (this is something that most CBers are not aware of).
Education is important to new amateurs -- this is something that older hams can provide.

"Never explain by malice that which can be more easily explained by ignorance". Note carefully that the last word is "ignorance", not "stupidity".
Given a chance (along with necessary knowledge) to make a correct decision, most people often will.

By using a piece(s) of wire, you wouldn't even need the PTT.

>
>-=Paul Flaherty, N9FZX

I must be missing something here, Paul. Maybe you need to explain the difference between "(en)coding" vs "modulation". I know that I could implement a CW demodulator (or decoder ?) as a state machine that follows a b-tree. Sounds pretty digital to me. I always thought a CW transmitter was either ON or OFF, which also sounds distinctly digital.

I also observe that most digital demodulators (which are usually FM in one form or another) employ analog technniques (such as slope detectors) in the early stage of the decoding process. Like I've said, I don't understand your distinction between decoding and demodulation.

As for CW being an AM mode, that's a bit of a stretch. While CW takes on two amplitudes there is no information in the amplitude itself.
Also, the sidebands are zero-width.

** End of Quote **
A CB rig by part 95 rules may NOT be VFO or frequency-agile controlled but
MUST be "channelized" so that it stays within the tolerances specified in Part
95...A ham rig on the other hand is NOT channelized....it can go where no man
ahs gone before...provided it stays within appropriate band edges! and
subbands/modes as well!
Also a CB may not put out more than 4 watts (yeah thats a joke...most CBs out
of the box will do 10! and some more) but most ham rigs on 10 will do MUCH
more than that....
CB to ham??? thats perfectly legal and being done all the time!!!

I have been following the arguments and comments about the introduction of the no code licence with some interest.

It seems that this licence is essentially the same as what is called a "limited" licence here in Australia, and has been available here for many years.

It certainly did not cause the breakdown of amateur radio here, the home of the oldest amateur radio society in the world. It did in fact attract many new members to the hobby that had extremely good technical knowledge and abilities that did not want to be bothered with morse code. Many of these later gained the code qualifications so that they had access to the HF bands below 30MHz.

The arguments being put forward against a no code licence have ALL been heard before and experience elswhere in the world has proven then wrong.

Your comments about welcoming these new members to the hobby are well taken and very timely in this argument. The hobby of amatuer has everything to gain from the abaility of these people, many of whom will have better technical knowledge and ability than those attempting to exclude them.

Just my $0.02 worth from a place where such a licence has existed for many years.

GOOD LUCK TO ALL THE NEW AMATEURS!

Haven't you ever had the +audio or ground leads break off inside a 4- or 8-pin mic connector while the 2 PTT leads were still intact?   I'd say it's happened to me about 5 or 6 times in the last few years.

Reminds me of the time some lid dropped my portable PC being used for logging right in the middle of field day. A la Murphy, it's bound to happen at the worst possible time.

You will be neither an old nor a new Tech. You will be a middle Tech.

Old tech's are those who passed the General theory exam, and need only a 13 wpm code test to become General.

Middle tech's will be those who passed the Tech theory test and the 5 wpm test. They will have, according to the info passed here, Novice HF and all other VHF+ privs. They will need a General theory test AND 13 wpm to make General. (Or, will the more intense new tech test qualify for the general theory test?)

New tech's will pass a new theory test. They get VHF+ privs.

> Somebody please tell me that I will indeed get to operate on HF.

It isn't up to us. It is up to the FCC. They seem to be saying "YES".

BJ--

The public service column of the December _QST_ is devoted to ARES/Data. It gives instructions on how to obtain it by mail, CompuServe, or BBS.

By the way, someone once pointed out to me that the terms "copyrighted" and "public domain" are mutually exclusive. Like Phil Karn's NET and NOS programs, ARES/Data is free to its intended audience, but is not public domain.

>Also, it book mentions that to use the ARES/Data program, you need the
>TNC to have the WA8DED firmware installed. Where is THIS available
>from? (I can burn the EEPROM, if I can get the code, or is it not
>public domain?).

The article mentions that TAPR sells these EPROMS.

>(BTW, this section of the book mentions a familiar name to readers of
>these groups... N6BIS, Patty Winter! Okay, Patty... help!!!!!)

What did they do--reprint my "Packet in Emergency Communications" article again? I know they used it in the _Public Service Handbook_ at least once.

Patty

p.s. Don't anyone bother asking me more about ARES/Data. I've seen it once or twice but otherwise know nothing about it. It runs on the wrong computers. :-) :-)

While I am a member of the league and have supported a good number of their proposals I wonder if they are really representing the needs and desires of the Amateur community.

Here is the track record:

1. 220 --- the FCC wins but may in time give us 216-220 plus 222 +

2. NPRM 90-55 the only thing the league got us was the ability to hold on to the novice class. (I supported the FCC here)

3. On the code waiver for the handicapped the FCC did it their way leaving the league out in the cold.

I think the ARRL needs to begin to hear the amateur community a little better and as well we need to be more vocal to the ARRL about our desires.

   Take a low power air rifle (or a pea shooter) and shoot two BB holes the right
   distance apart in the middle of the nearest window. After fishing the wires
   through, seal with silicone putty.

I thought he was joking.  Then I thought some more and that is
actually a good idea.  That way when you move out its about $5 for a
new pane.

Except that I have storm windows.  Certainly an idea to consider,
thanks.

Well, I went by what the book written by Stan Horzepa (WA1LOU) said:

"It [ARES/Data] is a copyrighted, public-domain program, available
without charge to anyone interested."

Personally, I agree with your statement, but I wasn't sure if it was
truly copyrighted or really public-domain, so I went for inaccurately
vague mode :-)

>
>>Also, it book mentions that to use the ARES/Data program, you need the

Someone else pointed out to me that this was NET/ROM... I remember when
that was first coming out, but I haven't used it much. (Unfortunately,
I haven't been active in packet for a while... I see all that's happend
and it's overwhelming!)

>
>>(BTW, this section of the book mentions a familiar name to readers of

Well, the book mentions "a set of... packet-radio guidelines and public-service events were compiled by Patty Winter, N6BIS, in 1986... An expanded version of these quidelines follows." Then it goes into what would be a little over two pages worth of hints and guidelines. It was very informative.

Overall, I really like the book. BTW, this is the 2nd edition to which I refer...

>
> p.s. Don't anyone bother asking me more about ARES/Data. I've seen it

Ah, there's nothing like loyalty to one's company!! Personally, all the modern day machines seem the same to me... [enter old-fart mode] I remember back in '05 when we had to boot the machine up with the switches on the front, and load in paper tape... and we LIKED it that way! (mega- :-))

Thanks for the help, Patty!

It would be worthwhile if someone could upload ARES/Data to a well-known archive site. People would then be able to get it via anonymous ftp.

If this has been done, which host has it?

Most of you probably already heard from other sources, but oh well, I'll post anyhow.

I called the ARRL during lunch today. The guy in regulatory affairs said that "the FCC announced that basically the morse code has been dropped from the tchnician class license and that the priviliges have been changed to allow operation only 6 meters and above. There will also be a more difficult test for technician".

So there you have it. A code free amateur license. Sorta like the U.K. license. He didn't mention any other changes, so I assume the novice license still exists, and that novices can upgrade to the new license by taking the more difficult test. He also didn't mention what will happen to existing technician class license holders; I assume they will keep their priviliges.

I disagree. People think that there is something magic in DSP (Digital Signal Processing), but it really is nothing more than fancy filtering. The human ear/brain is also a pretty fancy adaptive filter, and it can "fill in" missing text based on higher-level reasoning that would be impossible for a computer. For sending human-readable text at slow conversational (rag-chew) speeds over narrow bandwidth channels, CW is unmatched. It also has the advantage of simple, inexpensive equipment.

Well, I've been waiting all morning for the crowing to start and so far the wires are silent. The only explanation I have is that the word hasn't gotten out yet. So...for those of you who haven't heard yet...

Yesterday, 13 December, the FCC formally approved a new class of no-code license. The ruling will take effect in approximately 60 days. The basic outline is as follows:

- the name of the new class of license is "Technician";
- call signs to be issued from the same class as current Novice licenses (the 2 x 3 block);
- examination requirements are the current written elements 2 and 3a only;
- examinations will be administered under the current VE program;
- the new license will grant all amateur privileges above 30 MHz.;
- upon completing a 5 wpm code exam, the new Technician will obtain the same privileges as the current Technician class licensees.

Further details on administering the program are still being worked out. All of the 18 VEC's are now conferring with the Private Radio Branch of the FCC to set up the administrative procedures for handling this.

I had expected to see this in the ARRL bulletins this morning (Friday, Dec. 14) but nothing showed up. It's a good guess something will appear about it in Monday's bulletin. FYI, my source on this is W6NLG, President of the Sunnyvale (Ca.) VEC, as communicated directly to him by John B. Johnston, Chief of the Private Radio Branch at the FCC. Cheers.

OK, I think I know what the answer has to be, but I want reassurance. I passed the Novice and Tech theory and code tests on December 8, 1990. I was told that it would probably be late January or early February before my license arrived.

Will I be a new Tech or an old Tech? My guess is old, since I passed the 5 wpm code test. If it did come in as new Tech, I do have the certificate they gave me stating that I passed 5 wpm CW; that would let me upgrade to HF privs right away, right?

Somebody please tell me that I will indeed get to operate on HF.

>Now, some digital modes are certainly superior to others, and some are
>more suited for usage in high-noise (QRM) radio circuits than others.
>Let's not confuse the issue by branding CW as an *ANALOG* mode, especially
>since most digital modes in use today on UHF and below are merely digitally
>modulated analog signals, like CW.

Branding CW as a "digital mode" is sort of like calling a bicycle an automobile because it has wheels. While the symbols take on discrete levels, both the encoding process and the decoding process are very analog in nature.

>If you are branding morse as obsolete because of the modulation techniques
>then HF packet, AMTOR, and RTTY are also obsolete.

The problem here is that you're confusing coding with modulation. HF packet et al are all FM in nature, which is somewhat superior to AM modes like CW when it comes to decoding (orthogonality).

Old tech myths die hard...

This was not a small mistake. This was a MAJOR 30 dB error!

This procedure ensured that operators keep trying even after all reasonable conditions had been met. Fortunately for the QRM, some who believed the published procedures quit when they got the QSO number. They will be penalized for following the instructions and not adding to the QRM.

There were many published notes that claimed that once you had the number, that was it -- you had a complete contact. Now, after the mission, apparently, they change the rules.

Even as it was, I have log files showing some stations connecting over and over, and getting lots of different QSO numbers. If the system had worked as advertised, these folks would not have been rewarded for tying up the channel and blocking out the smaller stations.

Hopefully, people who believed AMSAT in the past will be less willing to do so in the future.

Alan

I will place into the above ham directory the NORD<>LINK DED clone
software for the TNC2. The Germans added a KISS mode so it's not
like you have to throw out all your KA9Q software! I think it's
called tf12.zip (The Firmware). Look for something similar in a day
or so.

I have not used parallel line for transmitting purposes.
But don't you think that it would be a mistake to run any antenna conductor or
open-wire feedline that close to a metallic object?
I would think that it should be a min of 1 inch away from any metal (pref.
1.5 in.) and that there should be no metal between the conductors in the
parallel line.

Why don't you install a thru-wall bushing, make a hole in a plastic window
pane, or in a piece of lumber cut to size, and placed in the bottom of the
window frame. Any open areas should be insulated with foam.
The window should be secured so that burglers cannot enter, but people
can exit safely in case of an emergency.

><editorial mode on>
>How will they enforce this? Seems like a mess to me.

It is not likely to be as significant a problem as it might seem. KA6A pointed out to me that the additional privileges that the otherwise codeless Tech would have are just the Novice privileges and mostly CW. How many people would NOT try for the CW test and go ahead and operate CW illegally? The biggest problems with this will be on 10 meters. But it won't be anywhere nearly as difficult as granting General class privileges by this means.

>Disclaimer: This is a breaking ham-radio story, and all the details have

>I apologise. If the FCC told me something wrong, too bad. Watch this
>space for details!

Once the FCC gets the official Report and Order out, we can see what the official status is, with rule change text and all. Check the Federal Register next week or so.

I am still curious what the effective date will be. 30 days lead time is typical, but not absolute. Making the effective date be Jan 1 would be convenient for identifying "early Techs" vs "late Techs" by just the year number on the license.

WHile the VEC's will be giving fewer code tests, they could very soon be giving more written tests.

For years I've been trying to tell anyone who will listen that connected-mode AX.25 is very ill-suited for "contesting" purposes. Unfortunately, the Sarex missions seem to place a very heavy emphasis on Joe and Mary HT being able to participate with no special knowledge, equipment or protocols, even though this wastes a golden opportunity to encourage Joe and Mary HT to try something new. and even though this results in absolute bedlam on the bands.

Anyway, what you really want is a simple three-way handshake. Station A sends a CQ with a sequence number. Station B responds by acking the Station A's transmission and including a sequence number of its own. Station A then acknowledges station B's transmission and goes back to calling CQ. That's it!

There is, by the way, NO protocol that will *always* ensure that two stations communicating over a lossy network will agree on whether or not they had a successful QSO. This is known as the "two-army problem" (aka the "coordinating generals' problem") and it is easily shown to have no solution. See Computer Networks by Tanenbaum, second edition, p397-398.

Could someone send me the circuit for the ROBOCOPY program that was published in the October issue of _73_ Magazine. I have the program which is intended to decode cw from the reciever speaker input, but don't have the circuit schematic. I will also need the pinouts for the serial port (25 pin and 9 pin).

The circuit is only like 2 transistors and a few other parts.
The parts list was included with the .zip file, but no schematic.

Thanks in advance.

+Yes but I wonder how long it will be before some ham sues on the basis of
+reverse discrimination or some such thing as this.  If an exception is made
+for a certain group, the death of the requirement cannot be far behind it
+would seem to me.,
+
 Better yet, a class action lawsuit! Since current TECH license holders are
a greater that 51% majority of all grades of licensees, it would seem only
logical that the 13 WPM requirement be DROPPED! And that all licensees that
have credit for Elements 3a&b be grandfathered General privs. The same should
apply to Advanced licensees that can pass Element 4b. Face it, CW's an artform
not an absolute standard of merit or measure! And it's days are numbered...!

I don't think so. With this logic, I could go around installing wireless
burglar alarm systems that used ham radio frequencies, and claim that
it was all legal because it was emergency communications.

Additional footnote. From (i forget) but probably a WWII vintage Radio Amateurs Handbook (they kept printing em...), there were articles on LF License Free ops and "wired wireless" (power line propagated LF.) I have no idea if these were actually used. I seem to recall that in certain areas (near military bases, ferinstance) even these were forbidden.

The Yaesu numbers are 757 and 767. I'm considering the 757 as my second rig, which is the cheapest of all of the above numbers.

The other school on this says to spend as little as possible on your first rig, see what annoys you the most, then trade for something that doesn't annoy you. I bought a Kenwood TS520 for ~$350 (less than most HTs), and have had a great time with it. The 520 has discrete transistors, 3 transmitting tubes, analog dial, and no synthesizer.

Curiously, Ten-Tec offers two versions of their top-of-the-line, one

that is synthesized, and one that is not. I think the Paragon is the
one for those people that are fed up with synthesizer birdies.

I agree with the comment about using CW. It is definitely illegal to modify a ham rig to operate on CB as the radio is not type-accepted for that service.

AL N1AL

This is a good question for all the net-lawyers.

Is it illegal to modify a rig to RECEIVE CB?

Is it really illegal to modify a rig to make it capable of transmitting on the CB band?   There's no question that it's against the rules to transmit with it. Is the mere ownership of a non-type accepted CB rig illegal?

Re: running twinlead down the exterior wall and into the house

When I installed some twinlead, I just nailed it to the side of the house with 1" box-type nails. To bring it inside, I drilled a line of closely-space holes, then joined all the holes into a slot by twisting the drill sideways. To keep the bugs out, I then used silicone caulk around to drilled slot.

I haven't started any fires... yet. :)

Re: No-Code license

Now that it's here, we must learn to live with it. I understand that there will be 2 classes of Technicians: one who has passed 5WPM and has all current Tech privileges; and one who has not demonstrated the Morse code ability, and is restricted to 30 Mhz and above. I also understand that there will be no call-sign differentiation. So how will we bge able to tell if a Tech who is operating below 30 MHz is authorized to do so?

=========
SpaceNews
=========

MONDAY DECEMBER 17, 1990

SpaceNews originates at KD2BD in Wall Township, New Jersey, United States. It is published every week and is made available for unlimited distribution.

* MIR NEWS *
============
U2MIR has once again become active from the Mir space station complex. Simplex radio contacts with U2MIR can be made on a frequency of 145.550 MHz FM when the amateur radio experiment is active and the spacecraft is above your horizon. U2MIR was supposed to contact WA4SIR on the Space Shuttle (STS-35), but due to Columbia's early return to Earth, the contact was

never established.

* OSCAR-21 NEWS *

The launch of AMSAT-OSCAR-21/RM-1/RS-14/RUDAK-2 has been postponed until 07-Jan-91 so that a Soviet official may witness the launch.

RUDAK-2 will not only carry a Mode B linear transponder, but also a variety of packet radio experiments with data rates from 400 to 9600 bps using various modulation schemes. It will be compatible with AX.25 protocols and those amateurs equipped for FO-20, PACSAT, LUSAT, AO-13 PSK telemetry, and UO-14.

Linear Transponder Uplink: 435.030 - 435.120 MHz (90 KHz)
Linear Transponder Downlink: 145.880 - 145.970 MHz (inverted)
O/P Power: 12 watts max.
Beacon : 145.880 MHz, CW telemetry.

Gain of satellite RX/TX antennas: 2.3 dBi each (dipoles)
Input sensitivity: -125 dBm (435 MHz) for a C/No of 45 dB/Hz

SAT-RX-1: 435.016 MHz +-10 KHz 1200 bps, FSK, NRZIC/Biphase-M (JAS, PACSAT)
SAT-RX-2: 435.155 MHz +-10 KHz (AFC) 2400 bps, BPSK, Biphase-S
SAT-RX-3a: 435.193 MHz +-10 KHz (AFC) 4800 bps, RSM, NRZIC/Biphase-M
SAT-RX-3b: 435.193 MHz +-10 KHz (AFC) 9600 bps, RSM, NRZI (NRZ-S) +Scrambler
SAT-RX-4: 435.041 MHz +-10 KHz (digital AFC) RX for RTX-DSP experiments

The downlink can be switched to the following operating modes:
Transmit frequency: 145.983 MHz

Mode 1: 1200 bps, BPSK, NRZI (NRZ-S) (like FO-20)
Mode 2: 400 bps, BPSK, Biphase-S (AMSAT mode for OSCAR-13 beacon)
Mode 3: 2400 bps, BPSK, Biphase-S (planned for OSCAR-13)
Mode 4: 4800 bps, RSM, NRZIC (Biphase-M) (like 4800 bps uplink)
Mode 5: 9600 bps, RSM, NRZI (NRZ-S) + Scrambler (like 9600 bps uplink)
Mode 6: CW keying (only for special events)
Mode 7: FSK (F1 or F2B), e.g. RTTY, SSTV, FAX, etc. (only for special events)
Mode 8: FM modulated by D/A signals from DSP-RISC processor (e.g. speech)

RUDAK-2 is a joint project of AMSAT-U-ORBITA, the Adventure Clubs in Moscow and the AMSAT-DL/RUDAK Group in Marburg, Munich and Hannover.

> I have not used parallel line for transmitting purposes.

Works very well. FOUR conductor parallel line works even better. Commonplace
(once upon a time) at commercial installations for very long transmission
line runs.

> But don't you think that it would be a mistake to run any antenna
> conductor or
> open-wire feedline that close to a metallic object?
> I would think that it should be a min of 1 inch away from any metal
> (pref.
> 1.5 in.)

1 or 1.5 inches can be tolerated for metal running at right angles to the
line. For metallic conductors running parallel to the line 6 inch separation
would be an ABSOLUTE minimum.

Another tip: avoid sharp bends in the line. Circular bends at least 1/20
waveength long at the lowest frequency should be used.

In article <1990Dec14.145827.14942@lonex.radc.af.mil> szarekw@lonexc.radc.af.mil
(William J. Szarek) writes:
>Dear Mr. Spencer
>
> Your comments regarding my favorite part of this wonderful hobby were not
>appreciated. Such slander serves no purpose except to segregate the already
>dwindling and politically impotent ham radio fraternity (es sorority :-).

Lighten up, Bill. The no-code battle is over, and the no-code license proponents won. This does not mean that the pro-code proponents lost. Those who like code are perfectly free to continue using it. (This even includes me from time to time.) Your overreaction to Henry's gentle ribbing reminds me of Shakespeare's line "methinks thou dost protest too much."

>"because they're stranded on a desert island which is well-supplied with
>analog electronic parts but has no digital parts." Very good old boy, i almost
>missed your subtle sense of humor. I wasn't sure, for a min., that you knew
>that phone transmitters need analog parts more than cw transmitters do.
>QRP CW rigs can be made that use a nand gate as the final amp! cant do that
>with phone. Hmmmm, cant do that with packet, need analog there too . . .
>even funnier still good show!

Are there no new arguments under the sun? Sigh. To paraphrase my reply comments on 90-55, how come you guys only mention the simplicity of the CW *transmitter*? It seems to me that a workable CW *receiver* is quite a bit more complex than the simplest AM receiver, the crystal set.

>"Morse is basically obsolete, since digital modulation techniques are far
>superior at punching clean signals trough noise" Sorry, here you are simply
>wrong. I suppose you could argue speed but not punching through. I have
>never seen a qrp (really qrp not 5 watts) rig that could successfully punch

>recall a QST article featuring a guy who got WAS on a qrp rig that used a
>nand gate for the final (i think it was something like .1mW output). No
>insult intended.

This argument is also answered in detail in my reply filing, and Bill, *you* are simply wrong. Rather than repeat the entire thing here, I refer you to it. Suffice to say that CW, as it is generally used in amateur radio (on-off keying of a carrier) is *extraordinarily* inefficient in terms of both bandwidth and power. Many computer-oriented digital transmission techniques exist that are far more efficient than manual CW, and some of them are even in use by amateurs. (This is not to say that these techniques don't also have a lot of room for improvement - they do.)

In a storm, yes. Any storm here is a figment of the imagination.

> So too we must be flexible, in
> our
> choices, when having to deal with a medium external to our usual
> pusuits.

Ah, but we don't HAVE to deal with this external medium. We particularly don't HAVE to rename ourselves to suit it. It's all a matter of OUR personal preference. I don't recall any messages from the Lord High Poobah of Newsgroups saying, "OK, you turkies, we need to change the name of that thing!"

> I'm somewhat at a loss to understand who gave you charge of defining
> for others what their hobbys may or my not be though...

I didn't decide it. I just saw it and pointed it out.

From: Benn Kobb KC5CW 75676,1705

To: ALL

The FCC today rejected the Communicator Class no-code amateur license proposal. Instead, it deleted the Morse code requirement from the Technician license. The vote was 5-0.

The full text of the Commission decision has not been released. It is expected in a few days or weeks. Only the News Release is available.

Here is the text of the FCC News Release, Dec. 13, 1990:

NO-CODE TECHNICIAN CLASS AMATEUR RADIO LICENSE Q&A (Based on FCC info)

Q: How does the "new" Technician obtain HF privileges (below 30 MHz)? A: By passing a 5 WPM Morse code test. The Volunteer Examiner (VE) will award a Certificate of Successful Completion of Examination (CSCE) and will notify the FCC that the Technician has completed the Morse test. This CSCE will be valid for life. No new license or callsign will be issued.

Q: Will the "HF" Technician have to identify in any special way? A: No. The FCC decided not to require a suffix or any other special ID for Technicians, whether or not they have passed 5 WPM. The regular callsign system will continue in effect. The only indicator that one has HF privileges will be the CSCE and the name on file at the VE Coordinator and FCC.

Q: I already have a Technician license. Does anything change for me? A: No. You will keep all current privileges including your HF privileges.

Q: The FCC proposed to get rid of Novice Class. Did this happen? A: No. Novice will remain as is.

Q: How many questions will there be on the Technician written test? A: Fifty-five. The FCC decided not to require extra written questions about the "utility and tradition" of Morse code.

Q: When will the "New" Technician license be available? A: By February, according to FCC staff.

Q: Why did the FCC do this? A: "The Amateur Service is not growing to the extent it probably should, based on what it has to offer. One of the reasons we think that providing a non-code entry will be helpful is that it will get people, particularly young people who have a primary interest in digital communications and computers, interested in this service." - Private Radio Bureau chief Ralph Haller, N4RH

In article <8444@gollum.twg.com> sawyer@twg.com (Bruce B. Sawyer) writes about a conversation with the president of the Sunnyvale (CA) VEC who spoke directly to John Johnson of the Personal Radio Division of the FCC:

> - call signs to be issued from the same class as current Novice licenses
> (the 2 x 3 block);

Did he really say this? Or did he say that it's true in 6-land where there are no more N6 calls available?

>Monday's bulletin. FYI, my source on this is W6NLG, President of the Sunnyvale
>(Ca.) VEC, as communicated directly to him by John B. Johnston, Chief of the
>Private Radio Branch at the FCC. Cheers.
>   AA6KX

You know, I got my first info from the Sunnyvale VEC's recorder and thought I was hearing more than in the FCC's press release reprinted here. Apparently this is why.

One other thing that Sunnyvale stated, which was not in thepress release was that testing was expected to begin on 15 February 91. The date was specific.

Howdy

I was wondering if anyone knew where I might find a ckt diagram
or plans for a homebrew 2m FM rig. I mainly would like to build
something to use a local repeater, so it should be able to do a
rcv/xmt shift and put out at least 5W running off 12V. Rock bound
is fine, since I just need to hit the one machine, but I wouldn't
complain if it was tunable - as long as it is stable, since the
rig is meant for mobile operation. I want to do this because I
need a knock-around rig for the car (using the HT mobile is a
pain) and because I like the smell of solder. However, if this
would be too expensive, I'll probably pick up an old rock bound
mobile rig at a swap meet instead.

I would prefer sources you know have such a circuit rather than
'I think X might have something like that.' I looked in my copy
of the ARRL Handbook and all the 2M stuff seems to be transverters
for an HF rig. Does anyone know if the 1991 Handbook has anything
new in this area?

Please reply via e-mail. I _DO_ read this newsgroup, but I don't
know if this subject has a wide appeal. If you think it does ...

Regarding Photo Radar -
A similar scheme was tried about 20 years ago in Arlington, Tx
(between Dallas and Fort Worth). There was a camera mounted on
a pole, and if you crossed two sensor wires in the pavement too

fast, it took a picture. This had only one major effect - since it was stationary, everyone would speed like crazy until they got up to the sensors, and then cram on the brakes. Lots of accidents there because people who didn't know about the system weren't expecting the guy in front to "panic" brake from 70 down to 50 in the middle of an open area.

Also, EVERY single weekend, someone would go out with a spray can of black paint and opaque out the lens. (not that I would suggest such a thing)...

Several times a year I drive (more like commute) between Flagstaff Az, and Ouray, Co. I've found that once you get away from the interstates there is *nothing* even on CB. A VERY few times I've heard Navajo up on the reservation, but that's it.

Once you get a little further east, it's not so bad (like Texas :-))... This summer I made several trips between Flagstaff and Fort Worth. Was driving in towards Amarillo about 9 at night when I passed a van with a WB0... license plate. I have my WB5... plates on. I switch on the CB and sure enough there he is. We had a nice qso, although it was tough to remember not to use our callsigns. Turns out he was originally licensed in

Denver, but was now living in Texas so he had what used to be
called an "out of area" license plate. I was originally licensed
in Dallas, so I have a my WB5... call on an "out of area" Colorado
plate. We had a big chuckle over this. Things sure have gotten
confused.

You certainly can't do it by callsign for ANY license class. Can you
tell by my callsign whether I am authorized to operate on 7.018 MHz?

As someone else pointed out recently, even the callbook data comes
out too infrequently to use that as a judge of someone's license
class. So you will have a hard time immediately proving that anyone
is out of band, not just the new Technicians.

On a slightly different subject:
Has anybody ever heard of a case when someone has been cited for
out-of-band operation during a contest? I would think the nature
of the beast would make it unlikely.

Mine says neither rec.ham-radio nor rec.radio.amateur. It does use the word "license". If what the license says is what we should use, then the group name should be amateur.radio.license.

> >Law: If it ain't broke, don't fix it.
>

The name is not broken. Don't fix it. The structure is broken. Fix that. Changing the name is not chaging the structure.

> >Corollary: Even if it's broke, I like it that way.
> >
> This is a refuge for those without the initiative to make things better.

There is still no evidence that renaming the group will make it better. Look up the word "ham". Look up the word "amateur". See which definition talks about radio. See which one doesn't.

Bill Vodall writes:
| Is it illegal to modify a rig to RECEIVE CB?

No. My unmodified DX-440 (Shortwave Rec.) is not type accepted and does receive CB.

| Is it really illegal to modify a rig to make it capable of

| transmitting on the CB band? Is the mere ownership of a non-type
| accepted CB rig illegal?

No. If it were, then it would be illegal to run ANYTHING with a 27MHz crystal in it. Last I checked, it was legal for a ham to modify a commercial amplifier (for personal use ONLY) such that it worked in the 10m band. This sort of modification almost always results in these amplifiers working in the CB band as well since the amp isn't really all that picky about a megahertz here or there. Thus, most hams who own 10m amps inadvertantly own CB amps.

It is illegal to transmit on the CB bands with non type accepted gear. Also, a type accepted CB radio which has been modified for ham use is no longer type accepted for use as a CB radio.

The long and short of it is this: if you want to have both a 10m radio and a CB in your car like I do, you can either operate illegally in the CB band or you can carry two radios. Given how cheap used CB radios are, there is no monetary reason to not carry two rigs. Given how small some cars are, there are lots of physical reasons. I finally chose to mount a ham rig in the car and toss the CB on the front seat when I really want/need to use it.

DSP filters can operate over a much wider range of bandwidths than the human ear/brain can. In particular, DSP filters can easily achieve bandwidths much smaller than the 50 Hz figure that is typical of a trained CW operator. This makes it possible for a DSP-based system to demodulate signals that aren't even detectible by ear. Examples include N4HY's demodulation of 4 bps signals from the Soviet "Vega" balloon probe in the atmosphere of Venus, and the N4HY/W3IWI DSP moonbounce experiment.

No, there's nothing magic in DSP. Nor is there anything magic about the brain/ear combination when it comes to operating as a modem.

>For sending human-readable text at
>slow conversational (rag-chew) speeds over narrow bandwidth channels,
>CW is unmatched. It also has the advantage of simple, inexpensive
>equipment.

If by "human-readable text" you mean something that can be decoded directly by the human ear/brain without any extra equipment, well, even the best CW ops I know still require a receiver and antenna. :-)

As for CW being the only mode that can use simple, inexpensive equipment, it depends on how you define those terms. Packet radio TNCs are fairly simple and inexpensive by my standards, inasmuch as they are usually smaller and cheaper than most receivers. And given the trends in digital vs analog electronics, I expect that the cost-effectiveness of digital communications equipment will continue to increase very rapidly.

Dube Todd asks how we will be able to tell the "with-code" Technicians from the "without-code" Technicians, given that there is no difference in the calls.

My answer: The same way you can tell that KA3XXX has an Extra license -

you can't.

Maybe the FCC database will carry the w/code notation, but I rather doubt it. If the code status is in yet another database, it doesn't seem too likely that even the Callbook will merge the two.

I, for one, think that our present alphabetical zoo of call letters is mainly the result of a failed effort at "administrative neatness" involving an exquisitely graduated series of license grades, each with its own block of call letters. It all failed when hams were allowed to keep the same call when they upgraded. How many of you would like to go back to the old system where upgrading REQUIRED a new call?

The trick is to realize that it doesn't matter. Clearly the FCC

doesn't care very much, or they would have come up with a way to tell.
If they don't care, why should you?
     - Brian

PS: When is dube gonna go pound on whoever maintains his site's news
software so that it put the Subject: line into the header instead of the
body of the message? I mean, if he can't follow Usenet rules, why worry
about the FCC? Which, after all, is more important? :-)

In answer to myself ;) - there were informal suggestions at the time of the
creation of the Technician that it be no code. The idea was promptly squelched
by the League HQ fossils, thus making the word safe for telegraphers for all
time. [:-)

Yeah! I am definately doing some of that here....no criticism of any
alternative views implied....it just seems like a murky area to me.
I have no problems with on-the-air repeater burglar alarms OR reverse
autopatches myself.

BUT....if you could justify the burglar alarm as an emergency transmission,
then that would allow you to use ham frequencies for ANY burglar alarms,
right?

>I disagree. People think that there is something magic in DSP (Digital
>Signal Processing), but it really is nothing more than fancy filtering.

Implementing FIR filters is only one component of DSP. Others include convolutional codes, correlation, etc., which improve reception. In any event, it's easier to build very steep filters with DSP.

>The human ear/brain is also a pretty fancy adaptive filter, and it can
>"fill in" missing text based on higher-level reasoning that would be
>impossible for a computer.

Again, this depends on the operator. A well trained operator can fill in missing symbols. The symbol time for CW, however, is much shorter than that for, say, human conversation; this is important in fading channels, where you may lose all of a CW symbol, but only part of a phoneme.

> For sending human-readable text at
>slow conversational (rag-chew) speeds over narrow bandwidth channels,
>CW is unmatched.

Most CW ops that I've heard carrying on "real" conversations operate at around 15 WPM. Compare that with normal human conversation at 150 WPM, and you can see where the "advantage" of CW comes from -- slowing down the information rate. I think if you were to compare a rate 1/10 PSK system to CW, you'd notice the difference.

> It also has the advantage of simple, inexpensive
>equipment.

So did spark gap. Time and technology made CW nearly as inexpensive as spark, and time will eventually do the same for DSP.

>

> I am interested in buying a Cushcraft R5 20/17/15/12/10m vertical. If you have used it, please mail me your opinion of it. I am particularly interested in how high it must be mounted to avoid interaction with metal below it. I will be mounting on a apartment roof with metal siding around it. Cushcraft claims the R5 only needs 6-7 feet of clearance to avoid interaction with objects below the plane of the radials. I am also interested in the effiency of the antenna. Thanks in advance.
>
> -Eric, kd3sp

I have received the following (somewhat edited) replies. The comments are very positive. I plan to purchase an R5 myself.

-Eric, KD3SP

From: "Stuart G. Phillips" <stu@suntan.tandem.com>

I have an R5 which I installed on my roof (approx 35' up) and used it to replace a Butternut (to get rid of the radials). The antenna goes together quickly and is well engineered. I've tried the antenna on the ground and it works almost as well as on the roof.

It gets out just fine ! If I can hear them, I can work them assuming opreating skill or comparable power.

Good luck
Stu N6TTO

From: Jeff Crilly N6ZFX <xanadu!jeff@uunet.UU.NET>

I have had one since august. I think its great. The swr bandwidth is real good. Mine is at 20 feet above ground; I use a radio shack heavy duty tv mast and tripod. I used it initally at 10 feet and it worked fine. The only problem with it is that 20 through 10 is usually dead in the evening when I operate, and I wish I had 40 and 80. Anyhow I am working on a diopole for 80 to alleviate that problem. I think that the bandwidth is wide because of the thick tubing they use.

The only alternative to this antenna is probably the isoloop for AEA and that antenna just looks like a hassle to tune. Also the barkerson and williams jobs are avaialble, but I think they are inefficent and have narrow bandwidth.

From: tom@ksr.com

I've had an R5 for about 6 months. I think that it's a fantastic antenna. It's not a beam ... but it sure does get out well. On 10, I'm told I am as loud as anybody else and have easily worked

everywhere on earth. It's almost as effective on 12, 15 and 17. It's
a little harder to break through a pileup on 20 but that's probably
because everyone else is using 1KW and I am using only 80 watts. Mine
is mounted on the roof of my house so I don't know if it would
interact with metal. (Either way, it's a hell of a lot easier to put
up that the 1/4 wave vertical that I had before with its ooodles of
radials).

Good Luck,

Tom

From: Jim Hollenback <holly@hpcupt1.cup.hp.com>

Eric,
I have had a R5 up for about 2 years now. Works fine, I have worked about
150 countries with it now. I do well in moderate pileups on Pacific island
stations and not to bad in Europe - can't beat the east coast boys if there
is a big pileup. Same goes for zone 8 if the 4's and 5's really want the
guy. But this should be no surprize. My R5 is mounted on 3 five foot masts
that are attached to the eave of the house. The base of the antenna is about
four feet off the eave. About six feet below the antenna is a metal fence.
I have good SWR on all bands (17 mtr sucks, but I have not installed the
new trap kit yet - mine started life as a R4 and I bought one of the first
upgrades. They sent me the new kit at NO CHARGE!)

My country count is pretty even between 10 and 20 mtrs, 15 is a little lower,
probably because I don't work that band as much. I have not worked 12 and
17 much, but 12 seems fine. I get honest 57's and 55's in Europe and the
South Pacific and Asia with 100 watts. Not sure what you mean about
efficiency, but the antenna seems to do the job.

Hope this helps,
Jim, WA6SDM
jholly@hpcupt1.cup.hp.com

From: Ken Mitchum <km@cs.pitt.edu>

I have had an R5 up for about a month, although I have not had too
much time with it on the air. It is up about 30 feet, is about 20
feet from a tree. I live in a fairly flat part of town (Point Breeze)
where there just isn't much room for any kind of antenna.

Running 100 watts out, I have had no trouble working whomever I heard.
This is mostly on Amtor and RTTY on both 20 and 10. I normally don't
pay attention to SSB, but I did notice the 10 meter JA contest one night
and worked about 15 JA's in about 20 minutes.

The antenna is fairly quiet in terms of noise pickup, which surprised me
a bit since I usually associate verticals with more of that. I have had
no RF problems with computers, which I did have previously with a dipole.
The antenna is a bit overpriced, and the hardware quality is not the best,
particularly in terms of the mast mounting, but it certainly works well,
and in my location is about the only thing I could easily put up.

>AL N1AL

It has GREAT advantages in simplicity (read cheap, light, compact, easy to build), but learning the code is simple for some and extaordinarily difficult for others. Even those who know the code VERY well are probably aware of how SLoooooooW the conversation has to be in CW. Not quite rag-chew as rag-chew is on voice (or AMTOR or Packet); usually one shortens everything to accomodate the slow baud of CW. That is another thing that makes CW another language for the novice "CW op."

Full duplex voice ("phone") is "rag-chew" at its best! It is hardly a narrow bandwith setup, but can be inexpensive and compact as well (that's what modern technology does for you). I don't suggest that we implement this on crowded HF bands but, then, rag-chew can be done on VHF, UHF, SHF... with an HT, a mobile, or a satellite ground station.

When it is almost impossible to get through, and I want or need to get through, I will be the first to use CW. For moonbounce and rare DX it can work wonders! But when my ship is sinking, I will pick up the mike first, because very few amateurs are likely to bother tuning in my CW signal in order to hear that I'm transmitting SOS.

When I feel like using CW, I will. When I want to rag-chew, I'll use phone. When my ears get tired of the noisy HF bands and the pops and squeals, though, I'll move to UHF FM. There WAS enough space there for full duplex yesterday!

****

The problem with rag-chew is that they are really disgusting looking after you spit them out! :-)

For digital communications purposes, much better active filters can be, and already are, implemented in silicon at amateur prices. Ask some of the folks doing digital satellite communications with modern modulation techniques.

Is SAREX for the elite of amateur radio, as is digital OSCAR operation,
or is it for the average ham?

Joe and Mary HT aren't going to be interested in buying new gear (a PSK
modem, for example, 1- isn't cheap, and 2- is a pain to get running) or
learning new software in order to be able to work the shuttle. Instead,
they'll complain loud and long about how those nasty AMSAT types aren't
interested in them, and, unlike the loud complaints about the low-
inclination orbits and Ron's operating hours, they'll have some basis in
fact.

You're right about the two-army problem, but the solution is not to exclude
the average ham.

| Will I be a new Tech or an old Tech? My guess is old, since I passed
| the 5 wpm code test. If it did come in as new Tech, I do have the
| certificate they gave me stating that I passed 5 wpm CW; that would let
| me upgrade to HF privs right away, right?
+---------------

The only upgrade involved is possession of a CSCE for Element 1A. So you will in fact be a Tech with code endorsement, and will have Novice HF privileges.

| Middle tech's will be those who passed the Tech theory test and the 5 wpm
| test. They will have, according to the info passed here, Novice HF and all
| other VHF+ privs. They will need a General theory test AND 13 wpm to make
| General. (Or, will the more intense new tech test qualify for the general
| theory test?)
+---------------

Given that the Tech license will be an entry-level license (else, what's the point?), I strongly suspect that the theory test will be added to from the

Novice question pool, not the General.

It wasn't clear to me from the ARRL bulletin whether upgrades from Novice to
Tech-with-code-endorsement would take the new test or the 25-question test.
If the new additions to the Tech test are from the Novice pool, then the old
25-question test [as opposed to the ancient 50-question test. OK?] may be
retained for upgrades from Novice.

It may not be clear to the FCC at this point either. We'll just have to wait
for it to hit the Federal Register, I guess.

| Yes. Why do I get this kleine Spannung that this is what they had in mind
| from the beginning?
+---------------
```

I don't think so; why would the FCC incur the wrath of so many hams by suggesting the demise of the Novice and Technician classes, if *this* was their real intent? They'd probably have gotten a clear "yes" answer if they'd suggested this from the beginning.

...now if only they'd give us 220-222 back....

```

The FCC today rejected the Communicator Class no-code amateur license proposal. Instead, it deleted the Morse code requirement from the Technician license. The vote was 5-0.

The full text of the Commission decision has not been released. It is expected in a few days or weeks. Only the News Release is available.

Here is the text of the FCC News Release, Dec. 13, 1990:

* * *

ACTION IN DOCKET CASE

FCC ESTABLISHES NEW CODELESS CLASS OF AMATEUR OPERATOR LICENSE (PR DOCKET 90-55)

The Commission has revised the examination requirement for the Technician Class operator license, thereby creating a new codeless class of amateur operator license. After these revisions become effective, an examinee will not be required to prove that he or she can send and receive texts in Morse code telegraph signals to qualify for a Technician Class amateur operator license.

The amateur service currently consists of five classes of licenses having increasing privileges and each being progressively more difficult to obtain. The classes are Novice, Technician, General, Advanced, and Amateur Extra.

The FCC noted that offering a codeless license class that authorizes control operator privileges at stations which transmit exclusively above 30 MHz, provides an entry level opportunity to otherwise qualified persons who find telegraph a barrier to pursuing the purposes of the amateur service.

Therefore, the FCC has established the Technician Class as the codeless class of license. This license includes all amateur privileges above 30 MHz. The Commission also amended the rules to grandfather frequency pr30
MHz to current Technician Class licenseeice Class operator license
in order to provvice and who can
pass a telegraphy requirement in place of the more comprehensive written examination requirement for the codeless Technician Class operator license.

In <karn@envy.bellcore.com (Phil R. Karn)> Phil writes:

>One of the local "industry newsletter" summaries reports that the
>cellular phone industry is feeling the effects of the recession. The
>article reports that the annual growth rate has declined to "less than
>25%", and that Motorola's cellular revenue climbed "only 10%" in 1990.
>
>These figures are indeed small compared to the 50% to 100% per year
>growth rate that the cellular industry experienced in the 1980s (from
>5,000 subscribers in 1983 to 5,400,000 now)

There's nothing amazing about this. When a new product group hits, and creates a whole new market, this sort of growth curve is rather natural.

>but they still look >awfully big when compared to amateur radio's growth
>rate in the same period...

Let's not forget that Amateur Radio's been around a while longer than
cellular. Wait until cellular has been around 60 or so years and then
compare growth rates.

I don't quite understand why a ham rig modified to run CB should be illegal. Shouldn't the only requirement be that the emissions from the radio meet all of the legal requirements for CB emissions? Forgive my ignorance, but that seems sensible to me as an engineer. Any other requirements would seem to be artificial. Like Mr. Spock said, "A difference which MAKES no difference IS no difference." If a ham rig puts out perfect CB emissions, then while it is doing so it IS a CB rig. What's the deal?

Also, is it legal to modify a CB to operate on 10 meter ham? As a new tech (of the coded variety), that seems to me to be the quickest and dirtiest cheap way onto 10 meter SSB. If I have an SSB CB that runs off of a phase lock loop, shouldn't I just have to change the frequency synthesizer reference crystal to move the whole channel set up into 10m ham?

Thanks,
Kip

>Tell you what. Come up with a name that describes the intended traffic as well
>as .legal, and is more inclusive than .rules, .regs, or .regulations, and I'll
>adopt it. Fair enough?

What is the intended traffic?

I think we clearly want all discussion of FCC rules in there.

But what about:
1. Proposed rules and petitions to the FCC?
2. NPRM's issued by the FCC?
3. Local antenna/tower issues, laws, covenants.
4. Scanner laws and related issues?
5. Bandplans and other operating agreements?
6. Repeater coordination?

The name .regs or .regulations seems to be way too narrow. Also .fcc would be equally too narrow.

The name .legal seems to exclude 5 and 6.

The name .rules seems to but somewhat vague but does seem to be broader.

If we can converge on just WHAT we want in the subgroup then maybe the NAME of the subgroup will come out of that.

In article <4458@lib.tmc.edu> jmaynard@thesis1.hsch.utexas.edu (Jay Maynard) writes:
>Is SAREX for the elite of amateur radio, as is digital OSCAR operation,
>or is it for the average ham?

You have to consider the context of the SAREX packet radio experiment. It was originally scheduled to fly in March 1986. At that time, packet was still a relatively new mode, and the packet "robot" was conceived as a way of popularizing it to the amateur "masses". Of course, as everyone knows, the Challenger disaster in January 1986 resulted in an almost 5-year delay.

I'm sure that if the SAREX robot had flown in March 1986, there would have been many complaints about all that operating time devoted to such an "esoteric" mode. But packet radio is hardly a novel mode any more; if anything, it has been vastly oversold in its present state (1200 bps). Does it really need additional priming?

I admit to being much less enthusiastic about DXing (and DXpeditions) than the average ham. To me it has always seemed little more than stamp collecting with a hi-tech gimmick. But I think it's still fair to ask these questions: when it's all over, what have you gained? What have you learned or created? Have you increased amateur radio's standing in the world?

I'm not saying that the experiment as flown was worthless; to be sure it was fun, it did generate some publicity, and it probably introduced some hams to the mechanics of satellite orbits for the first time. But I can't help but think that much more could have been accomplished.

The opportunity to fly a payload in space, even for a short time on a manned mission, is rare and precious. We should make the most of them, not automatically cater to the least common denominator. Several categories of payloads spring to mind:

1. Technology experiments: more efficient and/or higher speed modems; forward error correcting codes; internetworking tests, etc. The idea is that even though only a few can participate directly, the flight helps advance the technology so it can be brought into the hands of the masses more quickly.

2. Technology demonstrations. Closely related to #1, but using technology that is more mature but not yet widely deployed among the amateur population. The idea here is to create an incentive for the average amateur to learn about the technology and possibly get involved. Some fraction would then get "hooked" and continue to use the technology in other ways (e.g., terrestrially or with unmanned satellites).

3. Operations with high public relations value. My main regret about STS-35 is that they had to cancel the QSO with MIR. To me, this was much more important than the packet robot, even though it was about as low-tech as an "experiment" could be. There was strong media interest in this part of SAREX; just about every AP story I read mentioned it. But the packet robot rated little more than a footnote, if it was mentioned at all. Amateur radio could have gotten a much bigger boost out of STS-35 had the MIR QSO been pulled off.

Speaking of media coverage, has anybody noticed how the TV media handles those "color" stories on Desert Shield and MARS? The typical story shows some guy tuning an SSB radio, with an almost unintelligible voice coming out of it. The reporter almost always refers to the poor audio quality; I believe I even heard one use the phrase "low tech" to describe amateur radio.

What hurts is knowing that this is true. Face it, SSB voice across the ocean used to be a nifty gee-whiz thing, but now that the public is used to satellites and fiber, we hams and our technology have been left behind in the dust. The same thing happens when I try to demonstrate 1200 bps packet radio to somebody who uses 9600 bps V.32 modems every day.

We can do better, but if we always have to cater to the least common denominator we'll never get anywhere.

Phil

Uh, Jay, you will notice that "splut" is *not* under the "people" subhierarchy. I suspect this was not accidental. :-)

karn@envy.bellcore.com (Phil Karn) copies from Compuserv:

>NO-CODE TECHNICIAN CLASS AMATEUR RADIO LICENSE Q&A (Based on FCC info)

I really hate there Q & A things. They make up the questions to fit the answers they want to give you. Let's consider some REAL questions.

>Q: How does the "new" Technician obtain HF privileges (below 30 MHz)? A: By
>passing a 5 WPM Morse code test. The Volunteer Examiner (VE) will award a
>Certificate of Successful Completion of Examination (CSCE) and will notify the
>FCC that the Technician has completed the Morse test. This CSCE will be valid
>for life. No new license or callsign will be issued.

What about the Novice who upgrades to Tech? What will he have to prove to all those who question him about his operations on HF?

>Q: Will the "HF" Technician have to identify in any special way? A: No. The
>FCC decided not to require a suffix or any other special ID for Technicians,
>whether or not they have passed 5 WPM. The regular callsign system will
>continue in effect. The only indicator that one has HF privileges will be the
>CSCE and the name on file at the VE Coordinator and FCC.

What if the dog eats the CSCE, will the FCC issue a replacement one after that particular VEC has departed from the program?

>Q: Why did the FCC do this? A: "The Amateur Service is not growing to the
>extent it probably should, based on what it has to offer. One of the reasons
>we think that providing a non-code entry will be helpful is that it will get
>people, particularly young people who have a primary interest in digital
>communications and computers, interested in this service." - Private Radio
>Bureau chief Ralph Haller, N4RH

Why did the FCC claim to be taking away 220-222 MHz for development of narrowband technologies to correct a shortage of spectrum in the land mobile service when in fact the FCC is now establishing services and licensees in this spectrum to use conventional wider modes?

rc@CMR.NCSL.NIST.GOV (Robert Carpenter) writes:

>Dube Todd asks how we will be able to tell the "with-code" Technicians from
>the "without-code" Technicians, given that there is no difference in the
>calls.

>My answer: The same way you can tell that KA3XXX has an Extra license -
>you can't.

You can ask to see the license. The keyword is "ask". But you might get responses like:

1. My dog ate the CSCE and they don't issue replacements for those.
2. I had the Tech since 1990, but had to get this new one because:
    2a. I moved.
    2b. I traded in my KA call for an N call.
    2c. It replaced the one my dog ate.
3. I was a Novice and upgraded to Tech and:
    3a. I didn't think the Novice ticket was important and threw it out.
    3b. The dog ate the Novice ticket and there is no way to replace it.

As you can tell, it is going to be a bit complicated.

>Maybe the FCC database will carry the w/code notation, but I rather doubt it.
>If the code status is in yet another database, it doesn't seem too likely
>that even the Callbook will merge the two.

They do have this empty slot labeled "C" in the existing database dictionary.

>I, for one, think that our present alphabetical zoo of call letters is mainly
>the result of a failed effort at "administrative neatness" involving an
>exquisitely graduated series of license grades, each with its own block of
>call letters. It all failed when hams were allowed to keep the same call
>when they upgraded. How many of you would like to go back to the old system
>where upgrading REQUIRED a new call?

No way!

I'd MUCH RATHER go to a system where everyone gets a basic 2x3 call sign
no matter what class they have, and can BUY ($$$) a "vanity" call including
those no longer in use, silent keys (grace period for relatives to pick up
the call first should be in there). Also special event stations should be
allowed access to the 1x1 calls (yes, they are "allocated" to the amateur
service; see FCC rules part 2).

Notice also that the N4xxx and N6xxx blocks are getting VERY close to being
used up and they will be stuck with K[C-Z]4xxx and K[C-Z]6xxx calls.

Clearly the FCC doesn't care very much about taxi drivers using the
10 meter band, so why should you?

Clearly the FCC doesn't care very much if the land mobile service wants
the amateur spectrum for their own, so why should you?

Steve,

I've heard of Cactus, Condor and Walla, although living on the east coast I've not used them. In my own area I regularly monitor a linked UHF system centered in Philadelphia that covers NYC, NJ and eastern PA.

It is easily the busiest system that I scan (busier even than most 2m machines), and therein lies the problem. If you simply link a bunch of repeaters over a wide area, then you've essentially just built yourself a single very wide area repeater with all the associated problems. Unless you're targeting only certain specific areas, you're using spectrum no more efficiently than the single super-repeater.

I think the key lies in backbone linking systems that can multiplex, switch and conference multiple simultaneous channels so that individual repeaters can be selectively linked on user demand without involving repeaters without users involved in the conversation. Other repeaters in the network might be joined in separate conferences so the network as a whole could support multiple simultaneous QSOs.

I don't know if the Cactus/Condor/Walla systems provide this feature, but it seems highly desirable to me. Digital transmission is even more attractive in this situation since multiplexing and switching is now far easier to do digitally than in analog. Indeed, the economies of scale of digital transmission are such that each user's share of the cost of a digital backbone should be small enough to attract support from many more hams than are using the existing systems. Wide area linked repeaters should then no longer be a scarce resource limited to a private elite, but a mainstream part of amateur radio. And of course the backbone would be available to send large amounts of packet data too...

Phil

Subject: Update on Phased Vertical Arrays (long)
To: info-hams@ucsd.edu

In response to the request for help in explaining some problems I was having in building a phased vertical array for 40 meters, I have received quite a large
knowledgable
there are who obviously follow this group and will respond via email but have the good sense to stay out of some of the unresolvable debates. At any rate, the response I got was so great that I can see there's widespread interest in this topic. Hence this note is offered as something of an update on the topic and a consolidation of some of the suggestions I received.

First of all, I followed some of the initial advice I received and went back and
Each
was tuned in isolation of the other on a single 50 ohm cable. Next, I built a new phasing harness consisting of one 0.25 wavelength section and one 0.5 wavelength section of RG/11: 75 ohm stuff. I know that using multiple quarter-wave sections of 75 ohm cable will transform a 50 ohm load to a 100 ohm load. The two 100 ohm loads in parallel at the "T" connector then present 50 ohms to the feedline back to the transmitter. Without a good antenna noise bridge I'll never know for sure, but at least this brought the SWR down to around 1.25. Furthermore, it dipped in the vicinity of my design frequency (7025), so I treated this as absolutely good enough.

During actual use, it did show considerable gain in the general direction I wanted, but with some new anomalies. I have a second antenna I can use on 40 (a double Zepp cut for 160 and up) that provided a good reference point, since the broad side of the Zepp is in the target direction of the phased vertical array. The thing was absolute dynamite in the target direction--at least a full S unit, maybe more. What was curious was that the maximum gain seemed to be off counterclockwise (looking down) from the axis along the two verticals. It turned out to be a rotten idea for a contest: it put out a great signal to Japan (304 degrees from here), but was really poor toward Europe(at 25 degrees). Never again will I try to use a directional antenna I can't
turn in a worldwide contest.

In the comments I received back, opinion seemed evenly divided between people (who seemed to me to be knowledgable sources) about whether the harness should be built from 50 ohm or 75 ohm cable. I used 75 and it worked, but there sure were a lot of people who said to use 50. (I once built a 2 meter array using

50 ohm cable, and it did fine.) Next, the point was made to me repeatedly
about
opinion was
that the system needs to be tuned with an RF ammeter at the base of each to
insure that each gets an equal current flow when connected in the phased array.
Also suggested was using an antenna noise bridge at the base of each to get the
feedpoint impedences the same when connected in the array. Tuning is accomplished by adjusting the lengths of the delay lines (notice how easy it is to
say that, as opposed to actually doing it?) Several people made the point that
simply cutting the delay lines to the theoretical lengths will not result in a
90 degree phase shift. DL6RAI wrote to say that he had actually measured it at
70 degrees in one he had built this way. That computes with my experience of
having the direction of maximum gain offset from what I expected. However, I'm

I agree that CB is still useful and can be fun.

In article <1990Nov27.001114.3755@smcnet.smc.edu>, rblack@smcnet.smc.edu
(Russ Black, Media Center) writes:

>   One of the leaders of this trip had a CB to use in case of an emergency
>and the fact that he is not a ham operator. On this trip, I took my 2
>meter rig and my CB rig. I tried to raise people on 2 meters but got no
>one.
>

My biggest beef with 2m is that we end up with no one repeater, in the
San Jose area, having any real concentration of traffic-support
communication. Notable exceptions are machines on moutain passes that are
traversed by a highway. Perhaps there will be more traffic support on
2meters when the weather gets worse and there are more traffic problems to

report.

Does anyone monitor 146.52 when they are driving? This would seem to be a good way to maintain communication with nearby travlers.

I find 2m most useful for calling for help. The higher range of 2m is a big plus here. The downside is that you must find someone monitoring to get help in areas away from home where you are not a member of the repeater.

SUGGESTUION:
SHOULDN'T WE MAKE THE '911 AUTOPATCH' ACCESS METHOD COMMON FOR MOST OPEN REPEATERS?

Reports of not being able to get anyone via any of a number of 2m repeaters is a bit scary.   What happens now if one breaks down in the middle of the might away from home?

> I never really thought that I would ever use my old (CB) rig again.

I expected my 2 meter rig to obsolete my CB radio for travelling but I find both types useful.   I find CB is more useful for getting details on unexpected backups and smokie reports. This is true for roads that have lots of truckers. CB is also fine for car-to-car (over a short range). My biggest beef with CB is the skip in the daytime wipes out local communication.

...Dennis Henderson, N6TTW and still CB-equipped on the road.

My RS Pro-2005 scanner croaked a few weeks ago and it doesn't look like
Santa is going to bring me a new 2006. I have made several modifications
to mine including a COS LED, COS Relay, Quick-Call II decode, improved audio,
prototype S-meter, (read: I'm embarrased at the circuit) faster scan, and
removed the AC transformer. The scanner worked fine for nearly a year after
these modifications.

The symptoms are that it won't receive in any band. The microprocessor
seems to work fine. The radio scans, I have complete control from the
keyboard, and opening the squelch stops the scan. It appears the PLL
is the problem.

When this happened, my cat (actually my wife's cat!) knocked the scanner
off of my desk. It fell to a carpeted floor and was picked up immediately.
It was still working when it was picked up. When I was told, I looked at
the display and it was fine. I heard good audio on hi-band and uhf. Later,
(about 2 hours) I noticed the display showing partial seqments and appeared
locked-up. I turned the scanner off, checked the power connection (13.8) and
turned it back on. It was again scanning merrily along and all was assumed
well. When I realized that I hadn't heard any traffic in a while I again
checked the scanner. It was *hot* and not hearing anything -- even a 6-watt
radio at about 2 feet. I opened the scanner to look for a problem. I can
narrow it down to the PLL board being extreemly hot, but not just in one
place -- the whole board was hot.

No obvious signs of burnt componets. The service manual says it could
be one or all of the custom chips on the PLL board. I'm not competent
enough to try and find the problem, much less the cause, without guidance.

I am looking for known problems, ideas on what could have happened, or,
lastly, where I can get it repaired. I doubt RS will look at it with all
the mods.

Thanks in advance.

Try getting the program ATSLOW from a local BBS. This program is supposed to slow down the AT to XT speeds so programs like the Morse code practice progam run correctly.

>course, as everyone knows, the Challenger disaster in January 1986
>resulted in an almost 5-year delay.

Maybe it was relatively new to the folks in your area in March 1986; here, it was flourishing to the point that there was already significant band crowding. Packet didn't need popularizing, then or now.

>I'm sure that if the SAREX robot had flown in March 1986, there would
>have been many complaints about all that operating time devoted to
>such an "esoteric" mode. But packet radio is hardly a novel mode any
>more; if anything, it has been vastly oversold in its present state
>(1200 bps). Does it really need additional priming?

No...but then, that's only significant if that's the entire purpose of the experiment.

>The opportunity to fly a payload in space, even for a short time on a
>manned mission, is rare and precious. We should make the most of them,
>not automatically cater to the least common denominator.

...in other words, space is for the elite, not J. Random Ham, unless he

wants to spend limitless bucks on keeping up on the leading edge of
technology.

>1. Technology experiments: more efficient and/or higher speed modems;
>forward error correcting codes; internetworking tests, etc. The idea
>is that even though only a few can participate directly, the flight
>helps advance the technology so it can be brought into the hands of
>the masses more quickly.

Why is this necessarily a good thing to do on a space mission? What does
space provide that terrestrial experiments don't?

>2. Technology demonstrations. Closely related to #1, but using
>technology that is more mature but not yet widely deployed among the
>amateur population. The idea here is to create an incentive for the

>satellites).

You're again assuming large quantities of uncommitted funds. The average
ham will see that he needs to spend several hundred bucks to make use of
the technology, blow off the whole thing, and complain.

>3. Operations with high public relations value. My main regret about
>STS-35 is that they had to cancel the QSO with MIR. To me, this was
>much more important than the packet robot, even though it was about as

>But the packet robot rated little more than a footnote, if it was
>mentioned at all. Amateur radio could have gotten a much bigger boost
>out of STS-35 had the MIR QSO been pulled off.

I agree with you about this one. That we didn't hook up with MIR counts as
a major disappointment, even more so than the fact that I wasn't heard by
the robot. :-) What you're forgetting are the reasons that NASA approved
SAREX in the first place: education (which we accomplished, though not as
well as we'd hoped), and good old-fashioned PR - not for ham radio, but the
space program. They got that out of it in spades.

>We can do better, but if we always have to cater to the least common
>denominator we'll never get anywhere.

Yes, we can do better, but we shouldn't exclude the average ham in the
process.

CW transmitters are certainly about the cheapest and simplest way to send intelligence via radio. However, to do real *weak* signal work, the receiver needs to be more sophisticated than most voice receivers. The requirement for narrow filters with minimum ringing drives the price up beyond that required for voice reception. A *very* skilled CW operator with a very high grade receiver can do *wonders*. Yet, I have had sucessful AMTOR contacts where I couldn't reliably tell by ear that a signal was present. I could see it on the TU's scope though. I believe that a good AMTOR setup will get through when 90% of CW operators would throw up their hands. And the radio equipment does not need to be any more complex than a modest QSK CW setup. Of course like everything else, there is good AMTOR equipment and bad. In general, I have not been impressed with the do everything boxes. An ST-6 still outperforms the builtin modems on these things. There is room for a lot of improvement in modems and error correcting codes for mechanical systems while the human CW machine is probably as highly developed as it ever will be.

AMTOR equipment has more patience with fading channels and QRN and QRM than most CW operators. And when the channel is even modestly good, AMTOR will have higher thruput than CW. I haven't heard of any AMTOR moonbounce contacts (I believe the path length screws up the timing). But when reception of three dashes is considered a contact, I guess CW is plenty good enough. I really marvel at those rare CW operators who can reliably hear those three dashes down in all that noise. When I tried it, I was convinced that I was hearing CW in the noise when in fact my preamp was blown and there were no real signals there, just ringing filters and ears. So, like John Henry and the steam hammer, there are those rare CW supermen (and women) who *can* rival the mechanical systems in current use, but most of us are far from being such CW marvels, and for us, the machines win with embarrassing regularity. And with the advent of affordable DSP, the machines are only going to get better.

Well I can't quote a rule, but notice that QST frequently prints FCC news
releases about confiscated "illegal CB" equipment. The contraband is usually
crude "linears" and modified ham equipment. These seizures are not just for
operating, most seem to be truckstop operations offering the equipment for
sale.

Unless you're planning on using 9600 baud PSK (for UO-14, for example)
the stock 736 works fine.  I have the 9600 baud mod someplace, and will
email it if needed.  The only other thing that gets a bit squirrely is
interfacing a 736 to an AEA PK-232 -- the two just don't like talking
to each other, and there has been a fair amount of finger pointing by
each company claiming the other is to blame.  I've gotten the combo to
work for me by installing some bypassing at the PK-232 end and a 10K resistor
in series with the transmit audio out of the 736's back panel.

That's a hoot. I have seen exactly the opposite opinion regarding cross posting to groups not carried. Your software is broken if it allows you to post to groups that you have no way of reading. That was from someone with whom I was not involved in a discussion of any sort, much less on opposite sides. I tend to believe his opinion over someone who would grasp at straws to denigrate an opponent.

I have since added news.groups. It is sort of a waste, don't you think? Since every post here shows up in rec.ham-radio (or is supposed to, according to The Net Gospel), I now have twice the space used for the rec.ham-radio reorg messages, plus all the other discussions. Too bad some people can't live outside their precious 'guidelines'.

If you want a good cheap HF radio that covers all the WARC bands, but is not

general coverage, the Icom IC730 is an excellent choice. They are going
for about $400 on the used market, and they are nice and tiny if you want
to ever take it mobile.

OK; So install a siren on the site.  Noone will hear it.  But when the
intruder picks up the repeater's local mike, you WILL hear that:
"Hello, is there anybody out there?  Break 1-9...."
You'll come running, but by that time your repeater will be off the air
and who knows where!

Just hope the intruder isn't a jealous ham.
But in that case, it would be legal to have the burglar alarm.
Maybe he would ID for you!?

Actually, using your ham call on 11 meters is LEGAL! The FCC doesn't
care if or how you ID your CB station. So as long as you are running
a type accepted radio and don't mind folks knowing who you are, go
ahead and sign your ham call on CB.

johnan> clients and servers need not run as the same process.

What you want to do is essentially a network server like Mach, or user implemented domains like 4.2BSD (not yet implemented). Your network server is a (possibly multithreaded) process that takes "messages" from local processes, packs them up, and then accesses the hardware interface to send them over a particular medium (or viceversa of course).

To do it under Unix it is almost essential to have the ability to pass file descriptors in "messages", and to poll()/select() (the latter to simulate multithreading within the server). STREAMS does offer you these abilities, and so does UNIX domain IPC. I'd rather go with STREAMS on System V, even if you have a socket library.

I would go with a clone of the AT&T TLI as the API. When you try to open a connection, you must specify a transport provider; the library would then open a well known named stream to the KA9Q server (instead of linking to a multiplexor in the kernel and pushing modules therein), ask it to create an appropriate connection, associate it a file descriptor, and then return over the well known named stream that file descriptor.

I think this can be easily implemented also under monotasking OSes; transferring the file descriptor/handle from the "server" to the "client" would just involve an assignment...

If you want extra details, read the Accent IPC TechReps from Carnegie Mellon, and the Mach documentation on network servers.

If one is prepared to be clever (hacking the Unix scheduler a bit would help), the cost of two context switches on every transaction can be duly minimized.

Oh, I'm sorry. I expected that, since your site is on Usenet, that it would carry the groups that discuss Usenet itself - news.*. How foolish of me. Please feel free to continue in your ignorance - after all, ignorance is bliss, and you certainly appear to want to avoid being unhappy.

>   I have since added news.groups. It is sort of a waste, don't you

>the rec.ham-radio reorg messages, plus all the other discussions. Too
>bad some people can't live outside their precious 'guidelines'.

Adding news.groups wastes *nothing*, as does any crosspost. The article is neither transmitted twice nor stored twice on disk. It does allow those who follow the group creation process to weigh *all* of the issues before casting a vote. Further, the guidelines - which you show such disdain for - were designed to minimize the possibility that changes would be made that did not reflect the true wishes of the users and admins of the net. Failure to follow them would doom the reorganization effort, as there are many people who automatically vote against any proposal that violates them...or is this your intent - to torpedo a proposal that you obviously dislike in this backhanded manner?

"CW's an artform, not an absolute standard..."

More succinctly: We are no longer training the Signal Corps for WW I.

There are only 2 reasons to have any ham license requirement:
  (1) The skill is essential for someone to safely and effectively exercise
  the privileges that the license grants; or
  (2) though not essential, the skill is needed in order to build up our
  national reserve of skilled operators.

It's hard to justify code exams > 5 wpm on either of these grounds.
Learn code to 5 wpm, and you're ready to get on the air, and if you enjoy
CW, you'll have plenty of incentive to increase your speed on the air;
the FCC need not supply the incentive. We have no national need for a
trained reserve of fast CW ops.

>Is SAREX for the elite of amateur radio, as is digital OSCAR operation,
>or is it for the average ham?

Around Baltimore, it appeared the SAREX roboti was pretty much a
disaster.  I tried to get to the highest point around with the best
southern horizon, and wasn't able to copy a single packet (or even hear
any transmission) on the robot tx frequency from WA4SIR.  Of course, there
was the occasional silly person who accidently transmitted on the
robot tx freq, but that was another problem.  I was probably too north
to work it.  (Did anyone north of Baltimore work the robot from a non-
mountainous position?).  I think the duplex set up
further negates the ability of 2m packet to work (i.e. you could be
transmitting while the shuttle is).

But on the other hand, I thought it was a good chance to get "Joe and
Mary HT" on to space communication (although probably best for people
south of the Carolinas!).  Digital space communication is difficult
for people to get into because of the shear number of boxes they have
to buy.  Why doesn't some company build a digital 220/440 dual band
radio with built in PSK modems and a TNC?  If integrated and mass produced,
I'm sure this would bring down the cost of digital space communication.
I'd buy one!

>then while it is doing so it IS a CB rig. What's the deal?

This is because amateur radio operators are not licensed to service
CB transmitters. You must have a general radiotelephone license to do this,
as CB requires that operators use type accepted equipment (as does other
land mobile services). Amateur radio equipment is not type accepted, so
it can not be used on CB frequencies.

>Also, is it legal to modify a CB to operate on 10 meter ham? As a new
>tech (of the coded variety), that seems to me to be the quickest and

>of a phase lock loop, shouldn't I just have to change the frequency
>synthesizer reference crystal to move the whole channel set up into 10m

>ham?

And there is nothing stopping you from doing this -- amateur radio does
not require the use of type accepted equipment. You will have to do more
than just change the PLL to make this work, however.

Over here in Europe, ham radio got the chop rather quickly when WWII broke
out (some countries banned ham radio - except under the supervision of members
of certain political parties - *way* before WWII actually began).
Once the War broke out, most of the hams were drafted in any case (in the
UK there was a 'volunteer reserve' scheme under which hams were encouraged to
register their skills, and when the war broke out, this reserve of skilled
telegraphists, VHF/UHF experts etc. were just what the Military ordered....)
Anyone who is interested in some of the stuff British and Polish hams did
during WWII should read 'The Secret War' by Brian Johnson (BBC Publications);
a rather technical book full of pictures of AR88's and S27's and HROs.
In some countries, ham gear was actually impounded by the relevant national
administration, presumably so it would not be used by spies (sorry,
Special Operations Executives).

Pete Lucas G6WBJ G6WBJ@GB7SDN.GBR.EU PJML@UK.AC.NWL.IA 0793-411613

(p.s. i am not old enough to remember the above actually happening, but my
father spent WWII polishing 807's and 813's in the service of his country).

OUCH!!! I can think of many more phrases that are eminently more relevant. How about the niceties or are manners dead! S'il vous plait (PLEASE) [pronounced - si vu play - excuse weird phonetics] gets you a *very* long way. Merci (THANK YOU) [mercy] is another good one.

My advice to anyone travelling to *any* country is to invest in a phrase book and learn these plus the basic greetings. Then you can employ them with words you have picked up or sign language.

Flames to soc.culture.french

John.

Howdy:

I fear that AMSAT has not been emphatic enough in pointing out what is required for a successful shuttle ROBOT QSO. I disagree with these stringent requirements so don't shout at me (i.e. don't shoot the messenger). Let's say you connected to WA4SIR and you got the UA (your TNC said *** CONNECTED TO WA4SIR) and then you received your QSO number (Hello N4HY you are QSO # 234 . . . etc). You have a QSO and your QSL is in the mail right? _NO_ _WRONG_.

The following procedure is REQUIRED for you to be in the log IN ANY WAY upon its being dumped on the ground.

(1) You send a connect request to WA4SIR (SABM You->WA4SIR)
(2) You receive an ack from WA4SIR (UA WA4SIR->You)
(3) You receive your QSO # from WA4SIR (I WA4SIR->You)

I would have said here you were done and should be in the log but IF AND ONLY IF you have <completed> the next step are you in the log. THERE IS NO REPRIEVE.

(4) YOUR ACK TO THE I FRAME IS HEARD (RR You->WA4SIR)

A small percentage of those with QSO numbers managed step 4 as the crowds went wild after hearing a few get through 1-3. About the only way can you be sure that (4) was completed is that you will receive a QSL card from ARRL.

IMNSHO this was clearly a mistake. On the earlier missions if they heard you on a audio casette you got a card. If I sound down its because I too am in the QRZ and NOT the QSL list after two successful connects. I am urging that this be modified for the Ken Cameron mission. Comments?

73's
Bob N4HY

String platic clothesline through the slots and stretch it taut between supports.

> Or how about a good way to bring it into the house. I am thinking of
> drilling two holes right through the wall and using like #12 wire to
> go through the holes. Any better ideas?

Take a low power air rifle (or a pea shooter) and shoot two BB holes the right distance apart in the middle of the nearest window. After fishing the wires through, seal with silicone putty.

It is postulated in all the biographies I have read, that as a result of his decision to settle out of court on theft of intelletual property with RCA (whom he claimed stole FM and superhet from him), he became despondent and jumped. The timing of the events does make it appear this is likely.

Bob

>Ok, so what kinda licence would I need to (legally) operate a radar gun?

K-band radar guns transmit inside the K-band amateur band, so you're legally allowed to transmit there. X-band guns are only slightly higher than the amateur X-band allocation, but you could probably tweak the Gunn oscillator down a bit by varying the voltage a bit and/or retuning the cavity. The question that comes to my mind is whether or not this is one-way communications. I don't know whether or not one-way communications applies to transmitting with the intent of receiving your own signal back. It's two-way communications, only you are both the sender and the receiver, so I *think* it's legal. I'm sure somebody will clarify this...

>In the real world, if the operation were sporadic, would anybody really
>care?

Care? Probably not, unless you were causing inteference.
Find out? Highly doubtful.

You could apply for a radiolocation license. I don't know what the requirements are. I know you can get one if you say that you are going to use it for sports purposes, such as clocking baseball speeds, skiing speeds, or cars at a racetrack or drag strip (as long as it's a legal operation). You may even be able to get a license by saying that you are going to use it for some sort of an academic excercise, such as determing path loss given varying weather conditions or something to that effect.

Well, thanks to the good graces of Joel Magid (magid@esis.enet.dec.com), we have the following press releases today from the FCC.

Report No. DC-   ACTION IN DOCKET CASE   December 13, 1990

FCC ESTABLISHES NEW CODELESS CLASS OF AMATEUR OPERATOR LICENSE
(PR DOCKET 90-55)

The Commission has revised the examination requirement for the Technician Class operator license, thereby creating a new codeless class of amateur operator license. After these revisions become effective, an examinee will not be required to prove that he or she can send and receive texts in Morse code telegraph signals to qualify for a Technician Class amateur operator license.

The amateur service currently consists of five classes of licenses having increasing privileges and each being progressively more difficult to obtain. The classes are Novice, Technician, General, Advanced, and Amateur Extra.

The FCC noted that offering a codeless class of license that authorizes control operator privileges at stations which transmit exclusively above 30 MHz, provides an entry level opportunity to otherwise qualified persons who find telegraph a barrier to pursuing the purposes of the amateur service.

Therefore, the FCC has established the Technician Class as the codeless class of license. This license includes all amateur privileges above 30 MHz. The Commission also amended the rules to grandfather frequency privileges below 30 MHz to current Technician Class licensees.

In addition, the Commission decided to retain the Novice Class operator license in order to provide an alternate entry level operator license opportunity to persons who desire to pursue the purpose of the amateur service and who can pass a telegraphy requirement in place of the more comprehensive written examination requirement for the codeless Technician Class operator license.

Action by the Commission December 13, 1990, by Report and Order (FCC 90-///). Commissioners Sikes (Chairman),

-FCC-

Report No. DC- ACTION IN DOCKET CASE December 13, 1990

FCC MAKES AMATEUR SERVICE MORE ACCESSIBLE TO HANDICAPPED OPERATORS
(PR DOCKET 90-356)

The Commission has amended its rules to make the amateur service more accessible to amateur operator licensees who, because of severe handicaps, are incapable of passing the higher speed Morse Code telegraph examinations. However, the FCC declined to provide a list of disabilities. Instead, the judgment of a physician will be relied on to establish that a person is severely handicapped and cannot pass a telegraphy examination.

On August, 1, 1990, the FCC proposed exempting from the 13 and 20 words per minute (wpm) telegraphy examinations amateur operator licensees who are incapable of passing those examinations due to severe handicaps. Because of the international requirements, however, no exemptions would be granted from the 5 wpm telegraphy examination.

The rules adopted require a physician's certification and a release permitting disclosure to the FCC of medical information pertaining to the handicap. The Commission said that the term "physician" would be limited to practitioners with full medical privileges, that is, doctors of osteopathy or doctors of medicine.

With respect to whether administering volunteer examiners (VEs) should administer examinations that they had not passed, the Commission said that any VE who is not competent to perform the VE functions should not administer examinations.

Action by the Commission December 13, 1990, by Report and Order (FCC 90-///). Commissioners Sikes (Chairman),

I just called the FCC to ask about today's rule changes re. no-code. The individual that I spoke to seemed to be hedging his answers to my questions, maybe because they are still working on the exact wording of the public notice.

Anyway, what he told me was this:

1. The code requirement for Tech class has been dropped.

2. Tech class will only have privileges below 30MHz when they pass the morse element.

There will surely be other ramifications to all this that will come out in the public notice.

Since this individual appeared to be rather cagey, I didn't ask about
other morse requirements (handicapped or non-handicapped.)

So what this boils down to is this: still one tech license, two
different sets of privileges.

<editorial mode on>
How will they enforce this? Seems like a mess to me.

Martin Harriss KB2JYZ (now a <30MHz tech!)
martin@cellar.bae.bellcore.com

Disclaimer: This is a breaking ham-radio story, and all the details have
yet to come out. If I have misunderstood something that was told to me,
I apologise. If the FCC told me something wrong, too bad. Watch this
space for details!

>Or how about a good way to bring it into the house. I am thinking of
>drilling two holes right through the wall and using like #12 wire to
>go through the holes. Any better ideas?

Don't put anything lossy (like a wall) between the two conductors. That's where the electromagnetic field is. I use two #12 teflon-jacketed wires, close spaced so that their insulations are touching, to bring open wire feeders into the house through a small hole. Sure it's a bump in the line, the impedance changing from 600 ohms to say 100 ohms, but it really doesn't matter. The whole point of open wire is that the losses are so low that high SWR doesn't matter. The bump created by going from 600 ohms to 100 ohms is probably less than the mismatch between the antenna and the 600 ohm stuff at the feedpoint.

It would be very helpful if notices such as the base note were also posted to rec.radio.shortwave. There is no small number of serious SWBC DXers who are *very* much interested in this kind of data.

Thanks.

first an intelligent response to Shailendra Anant Save:

Many of us like code. Sure it is an old way to transmit information but code operators are very polite. Sometimes that can be very refreshing in light of the chaos on 20 and 80 meters. Not all cw nuts are old farts either. I became a ham in May 1990. This was just around field day. I spent 24 hours hammering at the paddles the best I could running the KB2KKH novice station for the WF2L (MOARC/GARC) team. I fell in love with code. I went from novice to extra in the 6 months because I simply loved the code. Simply put people use cw because they enjoy using cw just like people who use other modes use them because they are fun. That is what ham radio is all about F U N (occasionally the technological state-of-the-art is advanced but that is fun too!).

Now so I don't open a can of worms [yet :-)]. Here are my ideas about licencing. If someone is happy with the privliges granted their class of licence then great. Just because some classes have access to more bandwith than others does not make them "better" than other hams. If someone desires privlages that belong to a certain class licence than they should work for the new licence to get the privlages.

Unfortunately some people feel they must get an extra call for reasons of enhancing their self-importance. These are often the same people who belittle other hams who enjoy hamming and have no desire to run high speed code, etc. All an extra ticket does for you is allow you to be a VE, operate in space (funny, if you are an astronaut and a ham they waiver the extra class requirement to let you operate in space but, if you are an extra they won't waiver the astronaut requirement and let you on the shuttle! life is so unfair! ;-), and have access to a kc or so more bandwidth. Half of this added bandwidth is in the cw bands so those of us who like cw can run cw at high speeds. This is not exclusionary on a caste system, high speed cw is very different from slow speed cw and I like to know that there is a place in the bands that I can go to be challenged by good (no lids) operators who run 20+wpm. This is not something special, it is just a small portion of the band set aside for a particular mode. I guess I don't know what all the fuss is about. General class ops have voice privs on all bands so what's the big deal?

IMHO i dont know why advanced and extras have additional portions of the phone bands, i believe they should be open to everybody. (I admit it is nice to have a quiet corner to rag chew though when I do run phone :-}) The cw bands should be left as they are so that depending on your ability, and/or desire you can choose the appropriate portion of the band to operate. It is just as frustrating to a high speed cw op to try to work someone sending slow code as it is for a novice to work some lid who insists on sending 15 wpm cuz he doesn't know how to slow down his keyer!

****
**** WARNING FLAME ON *******
****

Dear Mr. Spencer

Your comments regarding my favorite part of this wonderful hobby were not appreciated. Such slander serves no purpose except to segregate the already dwindling and politically impotent ham radio fraternity (es sorority :-). Frustration of the magnitude desplayed in your 14 Dec 90 posting is quite in error. I will now disembowel your arguements one by one. Try not to read this to fast so you don't misunderstand a single word.

"For conformance with antiquated requlations" This is not a reason why we use code. It is not REQUIRED that we use code so clearly REGULATIONS are not why we USE code.

"Because they're old-fashioned" I am not old fashioned. I am 27 years old, hold a masters degree, run a farm, waterski, surf, hanglide, ride a harley, hunt, fish, hike, bicycle, dance, sing, and party. Clearly not the profile of an OF.

"because they're stranded on a desert island which is well-supplied with analog electronic parts but has no digital parts." Very good old boy, i almost missed your subtle sense of humor. I wasn't sure, for a min., that you knew that phone transmitters need analog parts more than cw transmitters do. QRP CW rigs can be made that use a nand gate as the final amp! cant do that with phone. Hmmmm, cant do that with packet, need analog there too . . . even funnier still good show!

"Morse is basically obsolete, since digital modulation techniques are far superior at punching clean signals trough noise" Sorry, here you are simply wrong. I suppose you could argue speed but not punching through. I have never seen a qrp (really qrp not 5 watts) rig that could successfully punch through a paper bag using "digital modulation techniques". However I do recall a QST article featuring a guy who got WAS on a qrp rig that used a nand gate for the final (i think it was something like .1mW output). No insult intended.

****
******* flame off ******
****

Sorry if this wasn't much of a "flame" but like I said CW ops are very polite.

It's fun. There's no particular PRACTICAL reason any more other than it's VERY economical. Try it; you might like it. If not, then you at least learned a little about communications history. In any event, thank heavens it's finally a question of personal preference.

well Paul, I will not enter the debate on souls, but, to add a little
to what you have said (I hope)...

and maybe add to the effort to answer Shailendra's question...

1) its fun
2) it is far easier to construct a transmitter for cw than afsk or ssb
   and sonewhat easier than fsk... cheaper too...

3) more people homebrew low power rigs to play with that are cw
4) because of the Q codes, and no accent, it is easy to have a basic
   no frills contact containing such info as call signs, names, locations,
   signal strength, greetings, etc. without knowing each other's language.

   of course, that could be done with Q codes on rtty, but it takes a larger
   amount of money.

Being an old fart, when I got started (pre ssb days) cw was a way for me
to be able to afford a rig I could build, and I guess the majic of communications with someone far away was a big thrill, that maybe the tones of cw
added to the mystique of it...

with the new rule that was announced yesterday, I guess the NEED has dropped
for VHF and up...

cheers
DFR

Silly me, Henry, all this time of being an old fart, I thought cw was the first digital (on and off, modulated by keying) modulation technique... and as far as punching signals through the noise, you will find it hard to beat (without the military budget) that active filter most humans have between the ears, occupying the cranial cavity.

hmmm, where did I go wrong all those years???

cheers!

At a much higher cost. It will be a looooong time before CW stops being the
best bang for the buck.

Hold the phone (pun???).

I thought that CW *is* a digital mode.

BNF:
<tone> := true;
<silence> := false;

Now, some digital modes are certainly superior to others, and some are
more suited for usage in high-noise (QRM) radio circuits than others.
Let's not confuse the issue by branding CW as an *ANALOG* mode, especially
since most digital modes in use today on UHF and below are merely digitally

modulated analog signals, like CW.

If you are branding morse as obsolete because of the modulation techniques
then HF packet, AMTOR, and RTTY are also obsolete.

Ben

Yes! I agree wholeheartedly. The SABM/UA and receipt of the I frame
with your QSO # should be enough.

I too connected, got a QSO number, but suspect my ack wasn't received.
This was on the second to last orbit, so I never saw a QSL list.
It was a real rush to see "CONNECTED TO WA4SIR".

I'll go one step further - with all the stations trying, why not save the QRZ list and QSL *BOTH* the heard stations and the completed QSO stations - with an indication on the QSL card whether you were just heard or completed a QSO.

Oh maybe one more thing - how about an external antenna on that robot arm or something? :-) I missed a lot of should-have-been-great passes apparently because of shuttle/antenna orientation.

}
}I would like to add to this. Since UK licences are renewed every year,
}and a fee is paid, the FCC needs proof that your ticket is current.
}When I first looked into this, about 10 years ago, I was told that I
}would have to send the receipt for the fee I paid for the UK licence
}along with the form 610A. It used to be that you only got a renewal
}receipt if you specifically asked for it at the time of renewal.
}
}In the end I found it so easy to get a US license that I just went ahead
}and did it.
}
I ran into the same thing with a Canadian licence many years ago. THe
Canadian DOC would not accept payment before Jan 1 for a renewal starting
April 1, usually I would get the renewal back in March and be off the air
from April 1 through early May when my new permit would come through.

With Canada the reciprocal permit is automatic now, but I suspect that you
could well end up with much the same situation.

BTW the reciprocal permit is NOT intented for a permanent resident even
though the FCC normally won't bother with this. If you change your visa to
"permanent resident" then you SHOULD get a U.S. license!

I almost hate to ask about this, but would someone please e-mail me a rundown of the "Herbie" situation? I listened in yesterday on 14.313. I heard Herb loud and clear; he seems to have a magnificent station. However, what I heard was a rational, reasonable man trying to enjoying chatting with other hams. He and his buddies were polite about letting other people join in.

What I also heard was hundreds of absolute jerks trying to shut Herb down via massive QRM (a violation of FCC regulations). Some of them were singing (which is also a violation of the regs). Many used foul language (yet another violation of the regs).

Then I tuned up a few kHz and heard an equally rational and reasonable sounding gentleman telling someone else that Herb had long since worn out his welcome. Unfortunately, he didn't elaborate enough for me to figure the situation out.

Please, I'm terribly curious. Obviously there are a lot of hams out there that ABSOLUTELY DESPISE Herb. I heard them myself. What is Herb supposed to have done to P.O. these people so much? I didn't hear anything bad. I don't understand why the people that don't like to listen to him can't just tune over to another frequency. After all, there's plenty of room for all of us. I thought we worried about not having enough hams, right?

Any elucidation will be greatly appreciated.

In the book "Your Gateway to Packet Radio", in a chapter discussing the use of packet radio for public service communications and emergency communications in particular, it mentions a piece of software called ARES/Data. The Clemson University ARC is interested in utilizing packet radio for emergency and public-service work, which is what the software is designed for.

According to the book, it states that it (ARES/Data) is copyrighted but public domain and available without charge. Is it available from an

FTP site, by any chance?? Are there any other sources for the software that anyone knows?

Also, it book mentions that to use the ARES/Data program, you need the TNC to have the WA8DED firmware installed. Where is THIS available from? (I can burn the EEPROM, if I can get the code, or is it not public domain?).

Thanks for the help!!

(BTW, this section of the book mentions a familiar name to readers of these groups... N6BIS, Patty Winter! Okay, Patty... help!!!!!)

Well, I too agree that the fcc has finally come up with an elegant solution. Of course, I think there may be some problems to work out. For instance, in the call book will their be any kind of designator indicating technician prior to no-code vs. after no-code ?

And, if we are supposed to be self policing, and I hear a technician talking on 10 meters, how do I know if he is legal or not ???

Well, it's a done deal, all we can do know is try to work it into our hobby as best we can.

Well, you still don't like it. Perhaps if you tried 20 meters in the section between 14.0 and 14.1 MHz, you might find otherwise.

But then again, you are too busy flaming.

Did that *really* happen or was it a fictionalized account of what *might* happen? I thought it was the latter.

What are the odds of a microphone element failing while the push-to-talk button stays in working order?

Do you have a computer nearby? A past issue of 73 magazine discussed building a QRP transmitter from a standard dip oscillator running at 28.636 Mhz. I believe that it's a fairly common component in some computers these days.

It was the first article I've seen where they applied the oscillator directly to a direct conversion circuit yet used a potentiometer on the output as the hundreds of milliwatts was too high an output.

I bet you could modify some TV twin-lead standoffs to work with the ladder line.

To bring it into the house without drilling holes, use two peices of coax braid flattened into a strip. Insulate them with electrical tape or whatever and run them between the sill and (casement) window. You should then be able to shut and lock the window without damage.

Am I the only one who finds this concern to be amusing? The thought of the
anti-no-code group ganging up on people using CW without a test strikes me as
something out of Monty Python.

Depends on what you call digital. Actually, time is part of the
BNF (dot = 3 * dash, etc). Time is also quantized, so it is digital
in the true sense, just NOT binary. The BNF would be:

```
dot := tone-for-dot-interval
no-dot := silence-for-dot-interval
dash := dot dot dot
intra-letter-space := no-dot
no-dash := no-dot no-dot no-dot
inter-letter-space := no-dash
? inter-wordspace := no-dash no-dash no-dash
```

I'm sure the space between dots and dashes is one dot time, and
the spaces between letters is one dash, and three dot times are
one dash time. I'm not sure about the space between words, or
if there even is one defined (I think you may just parse the
letter stream into words by context alone).

>Should it ONLY be 110 to 120 VAC?

In a previous life I worked for a company that made electronic instrumentation for utility companies and became aware of a number of apparent anomalies in the way power companies treat measurements. In general there are good historic reasons if you dig deep enough, and one reason utility companies resist a move to more electronic instrumentation is that it tends to give measurements more "scientifically correct" but not of "the traditional form". No-one likes discrepancies, least of all people spending money (especially other people's money).

Well, first off domestic tariff electricity service in the US is nearly always based on a nominal 120volt supply. The most common service is so-called "110/220volt three wire" service (really 120-0-120 nominal). There are exceptions, the most famous (?) being Con-Ed's so-called 110/208volt network service which is the norm in New York City.

There are no universal standards on voltage tolerance and regulation, prior to the Mid-1970s it was common for whole towns to be run on substantial excess voltage so that a couple of far out ranches would not have too low a voltage at their end of the line.   Marginally tapped transformers were one of the most successful approaches to better tolerance but the motivation was conservation. Before the energy crises utility companies had little incentive to conserve energy. Higher voltage meant more power sold, more power sold meant more fiscal turnover and more turnover meant more profit since the rate of return on capital was fixed by the PUC.   In the modern age where it is just about impossible to build (let alone profitably build) a new power station, they have a large incentive to match demand to (limited) capacity. (Anyone care to speculate what's going to happen when the US runs out of sufficient generating capacity - as it certainly will ?)

There are other oddities, for example traditional induction disk power meters (like you probably have on your home), have a tendency to creep, i.e. record finite but small power when the voltage is present but the delivered current is zero. Although negligible in the grand scheme of things this fault would be very noticeable so to overcome it the induction disks are made with a smallish hole in the disk to prevent creep. A consequence of the anti-creep hole is that a finite starting torque is needed to get the meter started (typically equivalent to 15watts of power).   Another anomaly is the limited harmonic response of the induction disk meter, this tends to make harmonic rich loads (notable fluorescent lights) appear to consume less power than they actually do. Utility companies definitely want to hush this up because commercial users are the big users of this type of load, and they are good business being cheaper to supply and paying a higher tariff than the domestic consumers (remember the PUC (Public Utilities Commission) sets the rates). So the Utilities resist more "scientifically accurate"

instrumentation as it would remove a well-hidden break that the commercial users are getting.
Another anomaly affects only service greater than 200Amp (not your domestic service) and that is that above 200Amps current transformers are usually used as part of the instrument, and guess what, current transformers saturate and go distinctly non-linear if there is any D.C. component in the load current. How can this be?   Easy - just have your pottery factory run its kilns as half wave loads and see the power bill decimated. Again suitable electronic instrumentation would be "scientifically accurate".

We also made QRZ at W6YX. We have third party confirmation. But, given the Doppler, one could make an actual connect only at maximum elevation (at least at our latitude), and since the robot heard us before that time, there was no way we could ACK it.

The robot is the proverbial Good Idea, since it allows for continuous coverage (even while the ham astronaut is doing real work). But yeah, the logger could use a little bit of work...

Could someone send me the circuit for the ROBOCOPY program that
was published in the October issue of _73_ Magazine. I have
the program which is intended to decode cw from the reciever
speaker input, but don't have the circuit schematic. I will also
need the pinouts for the serial port (25 pin and 9 pin).

The circuit is only like 2 transistors and a few other parts.
The parts list was included with the .zip file, but no schematic.

Thanks in advance.

Mike

I am writing to the authors of the QST article requesting that the
source code be made available, and also mentioning the iambic ON/OFF
request. I'll post their answer when I get it.

>I'm curious about this. Am I wasting my time to ground my radio to
>a copper stake? Why? And ... what about this aluminum "ground wire"
>that I bought at Radio Shack? Not conductive enough?

Grounding is important for lightning protection. Best is to run the coax through a lightning arrestor before the coax enters the house, and ground the arrestor to an 8-foot ground rod using a very short, fat wire.

If you have "RF in the shack" due to RF currents on the feedline, this should help that problem as well as long is the wire is really short, like no more than a foot or two.

Running a wire (even heavy braid) from the station equipment ground out to a ground rod usually won't make a decent RF ground, and is shaky for lightning protection as well.

Aluminum is an excellent conductor (although not as good as copper). The problem is that there is danger of galvanic corrosion if you try to connect it to copper.

Well, maybe this only happens in QST magazine, but I read an article about a man who was on a boat and had an emergency. All he had was a CB, and the microphone was messed up -- no audio. He was lucky enough to contact someone who could copy morse code, and got help fairly quickly.

Of course, for every situation like this, there's probably 100 more where the guy is in trouble and doesn't have a radio at all because he never got his license because he didn't want to learn the code!

What I personally like about CW is that the hams that you bump into are
nice. Very nice. Even the american ones. Try it, it's really FB man!

Actually the press release covers all that too.

Interestingly enough, has anyone else come to the realization that we now have three DIFFERENT technician Class license holders, with the only proof of your priviledges being the date you took the test.

Make sure you keep those original licenses, especially if you are one of the older ones who took the General Exam and 5 WPM CW.

For all you types experimenting with mobile CW the sideswiper type keys are (IMHO) the ONLY hardware worth considering. The use of keyers with memory are ok for the canned portions of the QSO but when you have to start talking then its time to get off the keyer. Keyers require more concentration than do manual keys. The motion with a straight key is not natural in any mobile mounting position. Mechanical bugs require a lot of concentration and suffer from bump-jitters on the dot contact. The sidewinder has a nice lateral movment, a

positive control pivot that does not bounce and is self
centering. Overall, its your character that comes out in
the sending and can be very pleasing to the listener.

Try one, you'll like it.

The radar is NOT telemtry, even if it is gathering statistics (whether
legal or not). It is still radiolocation in that it is determining the
location or velocity of a subject. If the resultant data is transmitted
via radio somewhere else, that would, or could, be telemetry.

I agree completely the name should remain "ham" and _NOT_ be
changed to "amateur." Ham is VERY widely recognized; I can't
tell you the number of times I've said "That's an amateur radio
license plate" and they say something like, "Isn't that the same
as ham radio?" Plus, to the average Joe Blow who is wading

through the .newsrc file on his U*ix box, rec.radio.amateur would sound like a discussion for a bunch of DJ's from the college radio station. :-)

Keep it "ham." Definitely.

Regards,
Eddy, N8FPW

Does anyone have the morse code in ascii? I am studying for my radio operators licence, and I just wrote a program to send me some beeps and bops for dots and dashes by reading from a text file. The problem is that I don't have codes for each of the letters and the numbers and special characters. Could someone send these to me? eg:

```
o - - -
s . . .
```

Also, could someone tell me what the delay in terms of unit time that one has to have between letters (characters). And between words?

I'll probably put this up for anonymous ftp after

I have done with it. Eventually it should be able
to take *in* morse and give the characters. It will
also have a noise includer. Something that will "forget"
to beep one or two dots or dashes in a word during
transmission. Good for real-time simulation.

Say, why do people use morse nowadays anyway?

Piffle! I own a Brown Bros. paddle and a Bencher. The Bencher has a
much finer feel and control to it. Besides that, the Bencher has a
heavier base, and doesn't move around on my table. I couldn't use the
Brown Bros. paddle without having a spare hand to hold it down.

I suspect that you would find the Brown Bros. paddle preferable if you
use heavy finger forces. I'm not sure. I do feel like my Bencher is
the best I've ever used.

Right now my BBM paddle is on loan to Ed WB2GOH who's enjoying using it.

There's nothing wrong with it, I just like the Bencher. :)

Oh? If you have a badly leaking water heater do you call an amateur plumber? When you are deathly ill, do you go to an amateur doctor? If you are involved in a law suit do you seek an amateur lawyer? Unless you answered YES to all three, then you yourself harbor negative feelings toward the word amateur.

am-a-teur n.
2. a person who does something without
professional skill

from the Webster's New World Dictionary, 1988. The Living Dictionary includes a phrase something like "usually with crass connotations".

The main problem with the term amateur is it is not specific about amateur what. Ham-radio is rather specific.

One of many scratching their heads right along with you is Masahiro Kitagawa of the NTT Research Labs in Tokyo who sent me e-mail agreeing that all this name changing talk is D U M B. Adding rec.ham-radio.legal is a good idea. The rest of the proposed change should be dropped as one of those ideas that pop up at 3 A.M. after eating tacos.

It doesn't surprise me that we have more intentional QRM in ham radio, or
more profanity, more hogging of frequencies, less tolerance for other
hams, etc.   We have these things in the rest of society too.  As long
as our society promotes a "look out for number one" attitude, these
problems will just get worse.  If you want a good example of "societal QRM",
just go out driving in rush-hour traffic.  Or stand in line anywhere for
anything.  Or go to a sporting event where there are a lot of drunk
people.

Tom Clark of the SAREX team reports that so far he has only received
about a dozen reports of QRZ beacons copied from the WA4SIR robot
packet station aboard STS-35. Those beacons listed the calls heard but
not necessarily worked by the robot. (I.e., calls captured by the TNC's
MHEARD command.)

```
    *******************************************************
    * Unlike the list of stations  actually worked by the *
    * robot, the MHEARD  list was NOT stored  by the TNC. *
    * This  means that  stations heard by  the robot will *
    * not be eligible for QSL cards unless the SAREX team *
    * sees QRZ beacon text containing their callsigns.    *
    *******************************************************
```

So PLEASE, if you captured any QRZ beacons from the WA4SIR robot,
forward them to SAREX@W3IWI.MD.USA or to sarex@tomcat.gsfc.nasa.gov.

One of your friends may wind up with a SAREX QSL this way! Maybe
another Usenetter! Maybe me! :-)

73,
Patty

Jim is dead on the money. A rec.ham-radio.tech or (gag) rec.radio.amateur.tech
is just what we need. The packet subgroup and the cries over the demise of
Ham Radio magazine demonstrates that there is a fairly large following for
technical discussion among the members of rec.ham-radio. Also a group with
a technical charter seems to avoid much of the flaming found in the base
group. I believe that the .legal proposed group would be a source of cross
posts to the base group and a subject of endless flame wars consisting of
"this belongs in legal" "no it doesn't, it effects us all" type exchanges.
The last thing we need is yet another subject to bicker about. Also almost
all of the "legal" rangling that prompted this group pertains to USA hams
only and should be distribution limited to US sites, preferably by a mailing
list not a full usenet group. Ham radio is a technical hobby first and formost
and deserves a tech group. A rec.ham-radio.misc can hold the remainder.

I have and continue to use the NASA 2-line keplerian elements sets posted in these groups. Much nicer than waiting for the "big brown envelope" from Goddard. However, other than dialing up the Celestial BBS for the latest elements, is there an ftp site I could grab them from? I know about the nachos.ssesco.com site, but these are only updated weekly. Is there a way to get the bulletins as they are issued via the net?

Comments/suggestions/"you're crazy" letters welcome...

I've noticed several comments concerning the use of LISTSERVs for placing files, since some sites, including mine :^), have no FTP access. I didn't see anyone else mention this, so I thought I would.

Any site with BitNet access can FTP files through the BITFTP server at PUCC. This server accepts mail messages with FTP commands in the body of the message, then performs the FTP transfer by proxy and mails you the result. It's awkward, a little slow, but it works. I just FTP'd the KH113013.EXE from KA9Q's node, and it came to me as 12 individual mail messages. I concatenated them, uudecoded the resulting file, and it worked just fine. I have not yet been able to get binary files in their native form, but uuencoding works fine. If anyone figures out how to get a binary directly, I'd sure like to know. I'm on VAX/VMS with JNET.

Anyhow, for more info you can mail a message containing the word HELP to BITFTP@PUCC and get the help document. I'll be happy to provide any help I can if you get stuck.

I found the following article on my local packet BBS...
good ideas for discussion and resolution of 20 meter mess:
Copied text follows:
==
Date: 901129/0223
From: K4EID @ K4EID
Message-Id: <17852@K4EID>
To: ALL @ ALLUS
Subject: Re BARF and other sociopaths

I propose we look at this BARF nonsense from another aspect. It was amusing at first to see these and some others start flaming everything and everyone with their verbal diatribes. But after days of nonstop garbage, it has ceased to be funny.

At even a hint of a request for some moderation the response is "you're censoring" or "you're violating my freedom of speech" which gets a few more people sending flames who don't really even know what the issues are. Around and around the mess goes, all triggered by a few well primed and prepared people who are playing games with the sensibilities of those on packet radio.

I have a couple of questions for you to ponder, however. Do you think if they or the KKK or the skinheads (or any of the others who profess to have the same misguided beliefs that they obviously do) walked into the offices of the press services or newspapers in this country, or into the offices of Time magazine, U.S. News and World Report, or any other credible organ of free speech and handed them the buckets full of crap they are flowing onto ham radio, that it would be printed? Do you think it would be printed even after cries of CENSORSHIP?

In fact, I believe there are marked similarities to the tactics being used by BARF as those described in "Marketing cynicism and vulgarity" by John Leo on page 23 of the December 3, 1990 issue of U.S. News & World Report. I quote from that article...

"Charges of censorship have been raised by the author and others, but this is a diversion and a bogus issue. There is no censorship issue here because no governmental body is involved telling us what to see and read. No one has a constitutional right to have his splattered fantasies published. Thousands of grotesquely violent novels are rejected by publishers every year, and this one should have been among them."

Isn't most of this garbage being rained upon us by these BARF bags just as offensive to the sensibilities of most of us?

"How can we get this dangerous junk out of the culture? Short of censorship, everything possible ought to be done, beginning with a serious national debate. Maybe it will eventually come down to boycotts. In the meantime, maybe we should recycle Nancy Reagan's slogan, "Just say no." The career of Andrew Dice Clay began to unravel the day that Nora Dunn and Sinead O'Connor stood up and refused to perform with him on "Saturday Night Live." That touched off a chain reaction of noes that included Jay Leno, David Letterman, MTV and more and more of the public."

I propose then that censorship has nothing to do with it. It is simply a matter of common decency and common sense. We do not stand and listen to these hate mongers rave on a street corner exercising their free speech. Nor do we let them into our homes when they show up ranting and raving about first one issue then another. Like the publishers, we have no obligation to hold the loudspeaker or give them our ears or the postage stamps to spread their distortions and opinions. Use common sense - if they want to communicate their own biased views, fine, but let them do it by connecting to and communicating with those that share their distorted opinions. If you want to connect to them, then that is your right (and your problem). At least it gives you the option of deciding for yourself.

Even if you are hundreds of miles away -- it's time to say "I'm sick and tired of this garbage and I'm not going to take it any more". If the guy up the street wants to fill the ears of you and your family with filth do you stand and listen? No! If a radical group wants to put posters and signs on your house or in your yard, would you let them - no. Then why do you let them put the same objectionable materials on your radio and computer equipment? So let's quit providing free newspaper services for the distasteful rantings of a bunch of sickos. If the next BBS up the line insists on continuing to rain this trash on you, then shut him off. This mode has too much to offer ham radio to let a few ruin it. And if you think they can't, look back a few years at Citizen's Band Radio and ask yourself what happened to one of America's most popular pastimes ? If you listened to the filth that was being aired in the same ways there, people with common sense and decency just turned the radio off and put it in the garage never to be used again. Do we want that same solution to the same type of problem in Ham Radio ? - I think not !! We have more options available to us than the CBers did. We don't have to listen or promulgate their rantings.

Yes, there will be some variations in the judgements of various SysOps, but let's let common sense prevail and do the best we can. Debating valid issues in an objective way is one thing. Bigoted propaganda is yet another.

Think about it.

>applied to "amateur" radio equipment.......
>
I always assumed it meant that the equipment was built to CCS ratings
rather than ICAS.

BTW, 'CCS' = Continuous Commercial Service.
     'ICAS' = Intermittent Commercial & Amateur Service.

I am the keeper of the nachos.ssesco.com site...  I get the elements
mailed to me directly from Dr. Kelso at the same time (or before)
he posts them to various newsgroups.  I'm pretty certain he only
gets them on a weekly basis (or at least only releases them that
often).  If there's a faster way we'd sure like to know--

"Oh! So *you're* the cause of my TV going on the blink!"

Talk to any ham with a large tower and beam. He'll tell you that the neighbors think that the beam makes TVI worse, when, most likely, it reduces it (because the radiating elements are being spaced from the susceptible devices.).

In the '70's, it was common for hams to be blamed for CB mischief.

Can't you do what the VECs do now with the old techs proving they were licensed prior to novice enhancement? I've heard they will take almost any proof, stuff like old call-books with your call listed. But the burden of proof will most likely be on the HAM to show he is, not on the FCC.

Just another plug for platypus.uofs.edu. There is a Morse Code program,
the HyperCard Stacks and even Stuffit 1.6 (necessary to unpack the Stacks.)

Feel free to grab whatever you need.

No; it would be legal because it involves the immediate protection of property
and possibly of limb (maybe the intruder isn't a ham and hasn't seen a 2 KV
power supply before).  In such an emergency, there is no question as to
legality.

If the source code were available, as I think it ought to be, then
it'd probably be within many people's capabilities to turn off the
iambic mode, or make that selectable.  One of the advantages of
```

building your own gear is that it can be customized, but without the source, this is pretty difficult with software.

As a tech, whose hangup on upgrading is code speed (I already passed the entire set of theory/regulation tests once), I would like to get the privileges, if the rumor happens to be true, but would also feel cheated of the necessity of earning the upgrade.

Ok, so what kinda licence would I need to (legally) operate a radar gun?

In the real world, if the operation were sporadic, would anybody really care?

I have a FT736R on order. I'm looking for mods that I might want to
consider. I'll be using this for Packet, Oscar, & Oscar Packet.

Thanks

Randy

Yes but I wonder how long it will be before some ham sues on the basis of
reverse discrimination or some such thing as this. If an exception is made
for a certain group, the death of the requirement cannot be far behind it
would seem to me.,

I'm asking Santa for a TM-731 for Christmas, and was wondering a few things:

1) When using dual-band receive (not repeater mode), can you have it set up for one PL DECODE tone in UHF and a different one in VHF? I would think you would need 2 decoders to do this - is this how the 731 is designed, that is, it requires one decoder for each band?

2) In cross-band repeater mode using the radio as a simplex range extender, is it possible to require, say, the 440 side to use PL decode while leaving the 2m side open?

3) Our 440 repeater transmits a PL tone back only when there is audio being received through its input (i.e. it doesn't transmit a PL tone while IDing, while giving the hourly time report, etc.). Since this is the case, if I'm using a 2m HT crossbanded through the 731A, can I turn the PL decode for the 440 side on so that I don't have to wait for the repeater's carrier to drop before transmitting on my HT? In other words, will it switch bands only after the carrier has dropped, or will it switch whenever the squelch is closed, in this case being once the repeater has quit transmitting PL?

4) Finally, with the PL decoder on (or off), will it pass the PL tone to the transmitting band with the PL encoder turned off (i.e. will it pass PL tones in repeater mode, or do they have to be regenerated)? This question is purely academic and probably has little relevence to anything.

Thanks for the info.

--- Jeff

murray@sun13.scri.fsu.edu (John Murray) writes:

> Is this very reasonable suggestion a personal affront to you or something?

If you took the time to read my original reply, you will find I take no affront at all to the proposal. Go back. Look again. (If you can't find it, I will gladly repost it. There are others here who need to reread it, too.) Show me the personal affront I took. Show me the "emotion" or "wild claims" I was accused of making. None of it is there.

If you look back at my original reply to the original proposal, you will note that all I did was ask the quite reasonable question - why? In response, I have gotten some pretty silly answers. Things like how bad it is there is a hyphen in the ham-radio name. I have had the dictionary quoted to me to show how the renaming is "real progress" (somehow, the dictionary has an opinion on the renaming), even though the dictionary defines ham radio better than it does amateur. (Look up the words "ham" and "amateur". See which one talks about radio.) And I have been told that there is no effort involved in this renaming.

I am affronted by people who make grandiose claims about what a simple renaming of a newsgroup will do and get bent out of shape when someone (me) asks the simple question: why is the renaming a good thing. I am affronted by people who get bent out of shape when I question the claims of 'real progress' (which they can't support) and the other subjective evaluation they apply but can't support. Much like your use of 'very reasonable' -- you don't want to support this claim, and all I want to know is why this is a reasonable thing to do. So far, there have been no good reasons. And don't tell me it is reasonable to rename an entire tree just to get rid of a hyphen.

As someone who has to do some of the work involved, I take affront at those who tell me that because they are at a site where it is easy to make this change that nobody has any right to question how hard it will be at other sites. They don't care -- it's easy for them. Since it's easy for them, it is easy everywhere. Pah!

I take affront at the person who claimed that, since I do not include my call in my .sig or my account name or anywhere else, I must not be a ham, and then implied that since I am not I can have no opinion in the matter. The same person who implied that since he has been licensed so long his opinion was certainly more important than mine. (Ha ha for him -- I am both licensed and for about as many years; as if it mattered either way.) This is just one more ridiculous claim made by the proposal supporters.

As a result of the silly claims and arguments I received in response to "why", I generated the alternative proposal. The entire proposal was based on what the original authors claimed they wanted to accomplish, using the same logic. It includes comments made by others, such as .cb, and expanded upon them to include a Part 15 group.

Anyone who chafes at the alternative proposal yet wants the name change must want it for some other reason than those already presented. Sauce for the goose, so to speak.

> I was going to refrain from voting at all, but now I think I'll vote just
> to piss you off.

What a nice reason to use for voting. What a nice sentiment. Certainly, if you have no constructive comments, make comments like this. Apparently, you have no arguments against the alternative proposal, since all you want to do is take pot shots at personalities.

You should examine the reason you added the john-stanley.personal.hier... I am not the one who suggested that the current hierarchy should be changed. You should point that illogic at the original authors of the proposal -- they want the hierarchy the way they want it. The Subject: CALL FOR DISCUSSION was a real misnomer. All that was wanted, it seems, was a CALL FOR AGREE WITH ME. (And remember, I did not pick the subject. The pronoun ME applies to the original author.)

Is there any doubt from the name that rec.radio.noncomm.amateur.ham is for ham radio or amateur radio? That is the prime reason for the change -- making the group easier to find. Rec.radio.amateur says only that the users are not professional users of the radio spectrum, just as the current name rec.radio.noncomm does not mean 'for professional radio only'. CB, Part 15, hobby classes in foreign countries. Yes, it will certainly add to the group to include debates about CB slang and baby monitors.

Oh, (the argument now goes) but the charter will exclude that. "Read the charter for r.r.noncomm, it says professional" I am told. If those looking for ham radio read the charter now and can't find us, then there is a more serious problem than just name. Let's fix that; it will gain us more than the name change will. The name change is a purely cosmetic move. It fixes nothing. There is no reason to do it.

But I forgot myself here. You didn't want to argue the merits of either proposal. You would rather just wave your hands and cast aspersions about the character of those you don't agree with.

I keep asking for real reasons. Nobody can provide any. If you can provide a reason, do so. Otherwise, keep your personal attacks to yourself.

If we are going to make changes, we better do it all now. So I have prepared a list of possible newsgroups. Please add to it if you like and the name "amateur" can be changed to "ham" if you really want.

:-) [enjoy]

Yes indeed - adopt Phil Howard's list or die!!!

If we are going to be patently absurd (as is the proposed reorg)
then we might as well do a decent job of it.

I'm curious about this. Am I wasting my time to ground my radio to a copper stake? Why? And ... what about this aluminum "ground wire" that I bought at Radio Shack? Not conductive enough?

I have a 40 meter dipole, full size. Sometime next year I'll convert it to a zepp when I can buy an antenna tuner because I'd love to get on 80 meters. My rig is getting into the VCR in the living room, but not the cable TV line. It does get into my TNC, and causes it to key the PTT on the 2m rig whenever I key the radio. I'd love some suggestions for dealing with these things.

About all I've thought of starting with is (a) grounding the rig, and (b) getting a stack of power line RF filters for the rig and some of the appliances.

Should I not bother with grounding the rig? Is it a waste of time?

Ref: netnews e-mail from Jeff...

First of all congradulations !!!!!!!!!

I've found all the advice on rigs posted have been good ones. I'd like to address your antenna quest. A subject of wide variety and considerable controversy, this depends on not only your budget, but also the space at your qth and local zoning rules...The following based on experience:

A. NON-DIRECTIONAL TYPES (mostly)

1.) VERTICALS: Good for DX; need small amount of space for the actual radiating element, but the ones that resonant at 1/4 wave definately need a good ground plane system of at least 1/4 wave. If you figure on a good ground plane that comes out to need a considerable amount of space. Also, just for your info. studies have shown that a ground plane that is elevated above the ground works better than one that is on or below ground level. An alternative is a vertical that resonates at 1/2 wave. I know of one on the market (maybe someone knows another) that is the R5, and it's > $200. Antennas 1/2 wave long are very independent of a ground plane so you would not have to worry about the space problem of a ground plane. Also, the angle of radiation is considerable lower thus providing improved DX possiblities.

2.) DIPOLES / AND OTHER VERSIONS THEREOF: Big point; they are inexpensive and work well. I've tried many types and happen to like the G5RV nonresonant balance fed version. 51 foot legs for 80 to 10 (double that works great for 160 to 10) and 450 ohm open wire balanced feed (see other postings on this antenna). I have made many DX contacts on mine most to Japan and England on 20, 15 and 10 with 25 watts PEP output SSB ! Although you'll need to use an antenna tuner (the Delta-T design works best, you can build on or buy one...MFJ just has just introduce one), its advantage is that you can tune it to resonate the antenna on all bands. Also, the antenna seems to work reasonably well even if the legs are not straight and use of the antenna tuner give you some degree of RFI suppression. And the antenna itself is quite efficient due to the fact that there are no loading coils in the radiating elements, although one does loose some power in the form of heat in the antenna tuner.

B. EXPENSIVE STUFF

1. BEAMS: You could go with a wire type i.e. Rhombic, but you'll need alot of space. Or with a rotatable yagi or quad. You'll find yagis to be easier to tune and better able to survive adverse weather conditions... Well you'll need a tower, best to have it at least 50 feet (big bucks here). All yagis on HF are basically the same. Most have only 10, 15, and 20 mtrs. To get on 30 and 12 mtrs (when you upgrade) would require additional beams. KLM makes some tribanders that tend to be somewhat more efficient due to the fact that they do not use the common loading coil method to resonant the elements. This method gives you a broad resonant passband with steep sides. I mention this because I use this type of loading to resonant the antennas I design and build on 10 mtrs and up...

...In the past I bought all my antennas, but now design and build my own. Yes it takes time, but I like the performance.

enough for now,
Let us know what you end up with...
Gud luck,

Thad   KG5ES

-- MAJOR SOLAR FLARE ALERT --

DECEMBER 12, 1990

Flare Event Summary
Potential Impact Forecast
Revised Prediction Charts
--> Geomagnetic Storm Warning Update <--
--> High Latitude Auroral Storm Warning Update <--

MAJOR ENERGETIC EVENT SUMMARY

An explosive surge of solar activity occurred today. There were a total of eight M-class flares today. Two of these were major energetic events. The largest event was the class M8.9/SF flare which occurred at 14:10 UT on 12 December. This flare originated from Region 6398 at a position of N10W72 and lasted 71 minutes. This region will disappear beyond the west limb tommorrow. No significant bursts or sweep frequency events occurred with this flare.

Region 6399 was by far the most active flare-producer today. It was responsible for five M-class flares today, including the major class M5.1/SF flare which occurred at 08:03 UT on 12 December. This latter event occurred at a position of N20W73 and lasted 57 minutes. No significant radio bursts or sweeps were observed from this event either.

Among one of the M-class events of today was an M1.6/SF flare which also originated from Region 6399. This flare is worthy of note because it was accompanied by a Type II sweep. The flare occurred at 11:12 UT and lasted 36 minutes. The shock velocity of the Type II sweep is estimated at 2000 km/sec.

No significant proton enhancements were observed today, despite the amount of solar activity which has occurred.

A significant drop in the solar flux is anticipated over the next 48 hours as the very active regions in the northwest solar quadrant rotated out of view beyond the west limb. The solar flux is expected to drop by as much as 30 points by 15 December.

As the regions in the northeast rotate out of view, all attention will be shifted to the northeast quadrant where Region 6410 is showing signs of increased flare output. Over the past 24 hours, Region 6410 (N05E32) has rapidly increased in size from 1,320 million square kilometers to 1,830 million square kilometers, an increase of 510 million square kilometers. Area, flare output and sunspot numbers have also increased within this region over the past 24 hours.

Regions 6398, 6399, 6410 and 6412 are all capable of spawning M-class flares. They are also capable of producing isolated major flares. Regions 6398 and 6399 will be out of view on 13 December and will not return to the eastern limb until near 27 December. Regions 6410 and 6412, however, are still in the eastern hemisphere of the sun and will remain in view for quite some time yet.

Region 6412 (old region 6368 which was enormous in size on its last appearance several weeks ago) has retained a great deal of it's size. Today, a significant portion of its old trailer spot complex rotated into view. Hence the size of the region was adjusted accordingly and now stands at 3,870 million square kilometers. The trailer spot region has definitely decayed since it was last observed several weeks ago, but this region is still capable of spawning M-class flares.

The sunspot number has been decreasing steadily over the past 48 hours, due to the rotation of active regions beyond the west limb. At the present time, the sunspot number is 208, but will drop further as the major active centers rotate out of view. Likewise, the x-ray background flux is expected to begin dropping over the next several days from its present C2.1 level.

GEOMAGNETIC STORM WARNING UPDATE

Geomagnetic activity increased notably between 22:00 UT and 24:00 UT on 12 December due to the effects of the major solar flare of 10 December. Activity has remained confined to mostly active levels over middle latitudes. High latitudes have experienced periods of minor storming.

Activity is expected to calm down somewhat on 14 December, but should be followed by another increase of activity due to the major solar flares which occurred today. This second increase of activity is expected to occur on 15 December. Levels of activity should be comparable to the activity experienced today (12/13 December). No significant storming is expected, although periodic minor storming may again recur over high latitudes.

HIGH LATITUDE AURORAL STORM WARNING UPDATE

The auroral storm which was anticipated for high latitudes never reached the intensities anticipated. Significant periods of auroral activity has occurred over the high latitudes, but the activity has been relatively localized. The auroral storm warning has been cancelled for all regions. Localized periods of high auroral activity may still be possible, but such activity will be isolated.

A slight southward expansion of the auroral zone was noted on 13 December, but the expansion was not enough to permit observations from low latitudes. It is expected to return to its normal position over the next 24 hours. However, it may again migrate southward slightly when the effects of today's major flare's reach the earth on 15 December. No significant migration is expected.

The prediction charts have been revised yet again to compensate for the major flare activity which occurred today. The previously revised charts are still valid, but will not be quite as accurate as the following revised charts.

PLANETARY 10-DAY GEOMAGNETIC ACTIVITY OUTLOOK (09 DECEMBER - 18 DECEMBER)

NOTES:

These VHF DX prediction charts are defined for the 50 MHz to 220 MHz bands. They are based primarily on phenomena which can affect VHF DX propagation globally. They should be used only as a guide to potential DX conditions on VHF bands. Latitudinal boundaries are the same as those for the HF predictions charts. For more information, request the document "Understanding Solar Terrestrial Reports" from: "std_oler@hg.uleth.ca".

                                     Make that class A licence if it's British.
>Britain but will be in the US for a number of years where I am at grad.
>school.  Can I just get a reciprocal license or do I have to subject myself
>to some other procedure.......??????

Strictly there's no reciprocal license, just a reciprocal operating permit,
that lets you operate your British station in the US.  Just get form 610A
from the FCC and return it with a copy of your licence. They send you
your permit in a couple of weeks (much faster than getting a US license).
It's good for one year, so repeat this procedure annually.  You can't
get a permit if you become a U.S. citizen or hold a U.S. license.
The downside is that you are bound by the terms of your own licence and
also the U.S. extra class license, so in theory you can operate Stateside
between 144 and 146MHz, but not between 146 and 148MHz, and not on
222MHz at all.    In practice no-one cares.  And the subset of the two
sets of regs. for packet would take a civil servant to untangle.  Anyway
you'll find that tnc2's don't understand reciprocal callsigns (GW4WFX/W3) :-(
So your best course is to get a 610A permit to get on the air, then start
working for your US license (much easier to get than a British licence).
But be careful, if you fail the 13wpm code test, do not take the 5wpm test
or you could end up with fewer priviledges than the 610A gives you.   73.

Any telemetry transmitter must have a control operator. I'm not sure if
"automatic control" is legal for telemetry. In the case mentioned above,

you could probably justify it as an "emergency" transmission. (It must be an emergency if there's an intruder).

I'm as good an armchair lawyer as anybody else! :-)

This sounds like a small terminated rhombic. I believe the loss is on the order of 3 dB (half an S-unit.)

> Maxcom took a lot of flack from QST about their matchers a few years back.

The Maxcom unit is little more than a resistive attenuator between radio and antenna. The loss is undoubtedly a lot more than 3 dB.

I agree with the comment about using CW.  It is definitely illegal to modify
a ham rig to operate on CB as the radio is not type-accepted for that service.
I also believe that modifying a CB to work on the ham bands would invalidate
its type acceptance for CB, even if CB performance were unaffected.  But I
won't tell if you won't.

A distinction should be made betweed RADIO ground and ELECTRICAL ground.
You stake-in-the-ground may work OK for electrical ground, which is
necessary.  For radio ground, though, it's useless, unless you live
next to a salt marsh or something.  Fortunately, you are using a
center-fed antenna, which does not require a good radio ground.

If you use a end-fed antenna, (like a long wire or a 1/4 wave vertical)
you need a good radio ground.

For everytime you have been asked the above question, down south I've gotten
the reply, "OH you mean CB!" And what follows is an attempt to explain
the difference between the two services...
It needs to be changed, not just because of regional perceptions which vary,
but because of international recognition.

>Keep it "ham." Definitely.

I disagree. It should be changed to amateur. What does your license say?
It says amateur, not ham.

Welcome to amateur radio!

My opinions (worth slightly more than you paid for them):

- Don't worry about 'analog' displays of frequency. The digital are quite good and plenty fine enough resolution.
- I think the "major brands" are all OK: namely Kenwood, ICOM, Yaesu (Ten Tec is probably OK too, but I don't have any experience with them.) I tend to prefer Kenwood and ICOM over Yaesu, but I can't really support that with hard data.
- It sounds to me like you may be price sensitive. If so, then you should look around for a used rig. If so, that means you should probably pay more attention to the condition of the rig and the price than the particular bells and whistles.
- If you are not so price sensitive, then I would check out the latest and greatest stuff, preferably at a local ham store.
- Consider the cost of the extras. With solid state output circuitry (which virtually all the new rigs have) you will probably need an antenna tuner. You will need a power supply, CW filter, maybe a desk mic. All this stuff adds up -- on a used deal it may get thrown in at low cost.
- I think you are on the right track with antennas. Put up a dipole or something to get you started. Low cost, reasonable performance.

Send me some E-mail if you have more questions.

It should be totally obvious by now that this is a failure. The code test has NOT prevented 80 and 20 from becoming like CB. Indeed, on the basis of what happens on the air these days and on the basis of the truly bizarre statements by code testing advocates, I have come to the conclusion the learning Morse code produces brain damage. The more highly proficient one becomes, the more unmistakeably deranged the behavior he exhibits.

There is no doubt in my mind that all Morse code products (keyers, computerized code teaching programs, etc.) should not be permitted to be sold or otherwise distributed without warning labels by the surgeon general. In fact, it may even become necessary to declare Morse code as a controlled procedure for which a doctor's prescription is required and which can be administered only by registered therapists.

It seems reasonable that a few generations from now, this communications technique will be looked back on by our descendants is being part of the primitive behavior period of history which included medical treatment by leeches, bloodletting, and surgery performed by barbers.

If it is still unclear, the 'official' descriptions of 'TOR (which was originally invented by the Phillips Co. for the Dutch post office for maritime telex use) can by found in the ITU's CCITT Recommendation #476.

I would like to add to this. Since UK licences are renewed every year, and a fee is paid, the FCC needs proof that your ticket is current. When I first looked into this, about 10 years ago, I was told that I would have to send the receipt for the fee I paid for the UK licence along with the form 610A. It used to be that you only got a renewal receipt if you specifically asked for it at the time of renewal.

In the end I found it so easy to get a US license that I just went ahead and did it.

As I said, this was a long time ago, so check the current regs.
Does one still pay anually in the UK? How much is it now?

Does anyone have suggestions for the best ways of mounting
ladder-line along the side of a building. In this case,
the ladder-line line is really the twin lead type that is nearly
and inch wide and has windows cut into it every few inches.
Some type of stand-off insulated mounting is what's needed here.
Hopefully someone has been through this problem before and
will have a clever suggestion or two.

Thanks for any help. 73,

Harry McGavran, W5PNY

No. My dictionary (something a non-speaker might use to look up words) gives a radio oriented definition for "ham", but nothing about radio for "amateur". So, looking up "ham radio" would give the correct answer, while looking up "amateur" would leave the poor fellow scratching his head.

However, it is claimed that renaming the group to r.r.a would make it easier to find. This leaves me scracthing my head along with the other fellow.

I have done quite a lot of experiments with HF antennas recently. I had these constraints:

1) I live in a townhouse, so antennas are not "allowed". The antenna had to be invisible, or at least not conspicuous.

2) Any wire antenna could be at most 50 feet long. (80 feet long if I put part of it in a tree.)

3) Forget about having access to a radio ground. My room is on the 2nd floor. I read enough books that said "don't bother with the copper stake in the ground" to know better.

I tried these antennas:

1. END-FED LONG WIRE IN A TREE. If you absolutely can't put anything on the roof, this may be the best option. It works pretty well, provided that it is really long. I started with a 25-foot wire; this did not work very well on 80m and 40m, and TVI problems on 10m were horrible. Winding it around my room and then out the window to the tree (100 feet) worked better. The problem is that it requires a radio ground, and of course an antenna tuner. I had some success with the MFJ artificial RF ground and a 20-foot wire on the floor. Also, it must be installed at night. (Unless you have neighbors that aren't suspicious of a guy throwing a wire-tied stone into a tree.)

2. ZEPP. The grand champion. I highly recommend it, as does the "Wire Antennas" book that the ARRL sells. I bought 25 feet of the regular Radio Shack pole mast and 8 feet of plastic pipe. (That makes 33 feet ... just barely above the roof line.) I spray-painted the pipe sky blue, which makes it almost invisible during the day. (at night, of course, you can't see it anyway) I bought 80 feet of sky-blue insulated 18-guage wire and cut it into two 40-ft pieces. One piece was stretched to just barely clear the chimney and go down the other side of the roof, and the other piece Went down the roof and into a tree. (This is why I used insulated wire.) The pieces were attached to the mast and fed with 450-ohm ladder line. (I originally tried 300-ohm TV twin lead, but performance was not good.) The mast went up the side of the townhouse, as anchored to the ground using the Radio Shack ground mount, and "guyed" using my window sill. The result: fantastic! I'm finally able to work 80 meters! Also, its performance on 10 meters is better than the verticals I tried. It's also almost invisible. Can't beat that, huh? Of course, you need an antenna tuner, but you don't need a good radio ground.

3. VERTICALS: Pretty disappointing. I couldn't get them up high enough. They were also too visible. They also weren't long enough to work 80 and 40. The reception on them was noisier too. My attempts at building a 5/8 wave vertical for 10 meters were not exactly fruitful.

4. DIPOLES: I could have installed a coax-fed dipole in the same way I installed the Zepp, but why? The Zepp works on all the HF bands.

5. "L" ANTENNAS AND FOLDED MARCONIS: No success. The Zepp still outperformed them. I actually had illusions of working 160 meters. With my MFJ artificial ground and half of my Zepp fed as a long wire, I could theoretically work 160, but it's still not long enough. I hear that a helically-wound vertical may work for 160 ... but I'm not sure if it's worth the try.

In conclusion, the Zepp is a great antenna! Someday, if I ever win the lottery, I'll buy a big estate and put up rhombic long-wire antennas.

> RATIONALE:
> ==========
> 2. Why .amateur instead of .ham? It has been pointed out in discussion that "ham radio" is primarily an American term, and carries little meaning outside the US.

When this question was first raised, I agreed that this was a reasonable issue to consider. But I haven't seen a consensus that it's true. I've gotten private mail from Australia, for instance, which supports the continued use of "ham." I'd like to hear from a few non-English-speaking countries before a change is made.

> In addition, there are negative connotations attached to "ham" that don't apply to "amateur". Some confusion also exists in the public mind about just what a "ham radio operator" is, as evidenced by the occasional "ham operator jams aircraft frequencies!" when the person in question has never been a licensed amateur radio operator.

By this argument, "ham" is better than "amateur." Any non-professional radio operator (pirate or not) is an amateur, by definition. If more people know "ham" to mean "licensed amateur radio operator," then "ham" better describes the intended audience for the group.

> OPEN ISSUES:
> ============
> 1. rec.radio.amateur or rec.radio.amateur.misc? Both have been proposed, and I don't have a strong preference either way. The final proposal will reflect whatever the consensus of the discussion is.

I favor the former. I understand that ".misc" has caught on as a way to lessen cross posting. Nonetheless, modern news readers only display cross posted articles once, and cross posted articles don't cost more except where the news software was implemented inefficiently using multiple copies of articles instead of links to articles.

Aside from the cross posting issue, the shorter name is "obviously" a better name.

And the ".misc" convention hasn't worked as well as we would have liked. Look at what happened to soc.culture.misc. Instead of attracting general discussion, it has actually repelled discussion. The various ethnic groups that would have used soc.culture objected to being "relegated" to a "miscellaneous" group, and ended up creating a bunch of splinter groups. The ".misc" group has less traffic than any of the splinter groups. I realize that this last point is not very relevant to your specific proposal. But I oppose the use of ".misc" when the use of modern news technology instead would solve the problem.

> It looks like we can bring this to a successful conclusion, especiallly if everyone maintains the same high standard of calm, reasoned discussion that's been shown so far.

That'll jinx it for sure. :-)

I was sharpening the groundplane (40 radials now), and tuned into '.313 again. What a weird corner of Amateur Radio. Twilight zone material. :)

From what I heard, Herbie was operating squeakie-clean-legal, and suffering hellacious QRM. My opinion is that what I heard of Herbie on .313 is ok. Maybe he jumps down to .300 and jams, but I don't know that. While BARF has some real lunatic- fringe ideas, the 1st Amendment entitles them.

I'm not clear on the who-did-what-to-who,when,and-where part. It sounds like the noise of several galaxies colliding, apparently BARF, the Seafarer's, and some 75 meter net I'd never heard about. I think they're all guilty - let's shoot them all and sort out the innocent later.

>
> In my experience, this term has no redeemable value with most "non-hams". In fact I would argue the connotations are so negative that we should do anything and everything we can to move to a more neutral term, and to dispell the negative connotations associated with Amateur Radio.

What are these negative connotations? I've never encountered them myself.

Anyone ever try building a cardioid DF antenna for the frequency range
in question, then using conventional DF techniques ?  I also have a
channel 2 problem, but the thought of building a 6 meter beam has always
stopped me.

>   Lee   W1/G8LCK

If you know a way, I want to hear it ! I'm sickened by ease at which
anyone with a transmitter can get on the air and maliciously interfere
with whomever they please. It's even worse on HF when the QRM is
international.

I think the ARRL/FCC care, but tracking down radio-terrorists is a
difficult thing to do. Maybe it is a reflection on the USA - we tend to
have a higher per-capita rate of sociopaths. Sigh. Too bad radio waves
don't stop at the border.

So, how do we get our own house in order ? Not talking with a LID
doesn't work, because then the LID finds other like-minded LIDs, and
form a Net. Trying to DF on HF is problematic - you may get within 50
miles of someone's site, but that's a lot of hams if it happens to be on
the East Coast metroplex. Shouting down a LID makes a LID out of
yourself. Maybe we need to create a new set of non-US amateur
frequencies (I thought that was the idea behind the non-US voice band,
but it apparently was lost on some of our cretins).

Maybe we should require another exam element - 1L(ID), which consists of
writing "I will not be a LID" 100 times every time you renew.

One Concerned Stateside Amateur,

Perry / KF0CA

Nntp-Posting-Host: thesis1.hsch.utexas.edu
Originator: jmaynard@thesis1.hsch.utexas.edu

(Apologies if this gets posted twice; I haven't seen the first one appear,
and it's been 6 hours since I posted it...)

There has been much discussion on this subject, and what started out as a simple call for a new group has mushroomed into a complete reorganization of the rec.ham-radio.* hierarchy. This posting reflects my understanding of the current consensus of opinion on the subject, and is intended to serve as the basis for further discussion. I gratefully acknowledge the help of many folks around the net, especially Paul Flaherty, who suggested the original reorganization from which this grew; he and I have discussed this posting, and it carries his approval.

THE CURRENT PROPOSAL:
=====================
The following groups are to be renamed:

```
rec.ham-radio        => rec.radio.amateur[.misc]
rec.ham-radio.packet => rec.radio.amateur.packet
rec.ham-radio.swap   => rec.radio.swap
```

Groups will be renamed by creating the replacement group, asking site admins to alias the old group to the new one, and rmgrouping the old group after traffic in it has died down. This method has been shown to work in other hierarchies.

The following groups are to be created:
rec.radio.amateur.legal
This group is intended to contain any and all discussion about legal issues pertaining to amateur radio, including, but not limited to, rules, regulations, laws, and legal actions by and against amateur radio operators. This group is to be unmoderated.

rec.radio.cb
This group is intended to contain discussions related to Citizens' Band radio. This group will be unmoderated.

RATIONALE:
==========

1. Why move the groups at all? The primary motivation is to make it easier for interested people to find newsgroups related to ham radio. The rec.radio hierarchy was created after rec.ham-radio (net.ham-radio before the Great Renaming). It is an inconsistency in the namespace to have groups for similar purposes separated from each other, and that makes it harder for new users to find the desired groups. Further, this allows a change from ham radio to amateur radio (see next topic).

2. Why .amateur instead of .ham? It has been pointed out in discussion that "ham radio" is primarily an American term, and carries little meaning outside the US. In addition, there are negative connotations attached to "ham" that don't apply to "amateur". Some confusion also exists in the public mind about just what a "ham radio operator" is, as evidenced by the occasional "ham operator jams aircraft frequencies!" when the person in question has never been a licensed amateur radio operator.

3. Why a .legal group? A significant part of the traffic in rec.ham-radio is concerned with legal issues. This includes substantially all of the flamage, which has in the recent past included such subjects as whether or not it's legal to order a pizza via an amateur repeater, the proposal to add a class of license that does not require knowledge of the International Morse Code, and the legality of modifying amateur equipment to transmit outside the amateur bands. The new group is intended to move the flames and the long discussions that never seem to get anywhere out of the main group.

4. Why use the name .legal, instead of .rules, .regs, .regulations, etc.? The group is intended to contain any and all discussion about any legal issues pertaining to amateur radio. This includes not just rules and regulations of the FCC and other national regulatory bodies,

but also laws affecting hams (such as the infamous New Jersey scanner law), lawsuits over nuisance issues, antenna ordinances, and the like. .legal is the best description of the intended division of existing traffic I could come up with.

5. Why not a .tech group? There are two reasons for this one. The first is that there's more to ham radio that's non-inflammatory than just technical discussions, and the object of a new group is to move the flames, not run away from them. A .tech group would leave those of us who are interested in more than just technical discussions, yet not in the seemingly endless legal discussions, left to wade through the flames. Second, Brian Kantor, who maintains the info-hams mailing list, has said that info-hams will continue to gateway rec.ham-radio (and, presumably, rec.radio.amateur[.misc]) only, and moving the technical postings off would deprive those on the mailing list.

OPEN ISSUES:
============
1. rec.radio.amateur or rec.radio.amateur.misc? Both have been proposed, and I don't have a strong preference either way. The final proposal will reflect whatever the consensus of the discussion is.

2. rec.radio.amateur.packet or rec.radio.amateur.digital? I do have a preference here, but am willing to change my mind if a consensus is reached that .digital is a better idea.

PLANS:
======
Assuming a consensus is reached by then, I intend to adhere to the schedule I set originally: discussion to run through 31 December, with the vote starting then and running through 21 January. There have been a couple of other reorganizations in the recent past, and I'll follow the precedent they set in regard to voting: an individual vote is required for each proposed group. In addition, I like Kent Paul Dolan's format for the comp.sys.amiga reorganization vote, and will use it for this vote (though I'll put the ballot at the top of the Call for Votes). I intend to count votes automagically with some sort of Unix-type tool (probably awk); votes that the awk script rejects will either be fixed if their meaning is unambiguous, or returned with a request for clarification if not. Other than that, votes will be acknowledged en masse about halfway through the voting period, and not by mail. Votes will be sent to this site, and probably to my account here. (Don't send me votes yet; I can't accept them.)

It looks like we can bring this to a successful conclusion, especiallly if everyone maintains the same high standard of calm, reasoned discussion that's been shown so far. Please post any discussion to news.groups as well as rec.ham-radio, as per the guidelines.

Yes, but there are a lot of old Techs out there (like my wife - KA3NQD and
my father - KA3ILE.)  Sure hope all the rest of you kept your original
Tech license.  It's the only way to prove which test you took.  The FCC
database only lists the last time you changed, not the original test date.

I think you're mistaken. By that line of reasoning, fingerprint evidence would
not be admissable unless you had an eyewitness to tetify that he/she saw the
defendant make that fingerprint on that object.

I don't think the average layman gives a hoot what we call ourselves and even if they do, who cares? We should call ourselves what WE want to call ourselves.

Speaking for myself, I have been quite happy calling myself a radio ham for the last 40 years. When anyone asked what 'W8GRT' was, I said "My ham radio call letters." Nobody ever came back with "What's a 'radio ham?'" A few wanted to know if that was like a CB'er, but none wanted to know if that was an actor or an advertized product on the radio. They ALL knew it was some form of personal hobby two-way radio.

So, what's the big deal? Who needs changing the name of our hobby to fit some cockamamey Usenet organization table?

-- MAJOR SOLAR FLARE ALERT --

DECEMBER 10, 1990

Potential Impact Forecast
--> MAGNETIC STORM WARNING <--
Flare Event Summary

MAJOR ENERGETIC EVENT SUMMARY

At 06:54 UT on 10 December, a major class M5.8/2B flare erupted from Region 6398 at a location of N15W47. This flare was accompanied by strong Type II and Type IV sweeps and weak discrete radio bursts. This flare is a major event and is expected to have a moderate to potentially strong impact with the earth. The estimated shockwave velocity is 1400 km/second, which is easily capable of producing a minor to major geomagnetic storm. The flare was a long-duration event, lasting 103 minutes (1 hour and 43 minutes). It began at 06:54 UT, and reached a peak intensity at 07:54 UT. The event ended at 08:37 UT. A SID/SWF event is strongly suspected of being associated with this flare, although this has not yet been confirmed.

Region 6398 produced the majority of today's energetic events. Along with the today's major flare, it has produced several C-class flares and numerous subflares. This region is a relatively small (540 million square kilometers or 211 million square miles) group with only 15 spots encompassed in the region. It is has a beta-type magnetic configuration, but has a complex magnetic inversion line where the major flare originated. This region is still capable of producing several more M-class events, but is not expected to spawn any other major flares.

No significant proton enhancements were observed throughout the period. This major flare was not a proton flare. Its involvment with strong Types II and IV sweeps, however, indicate that an interplanetary shock is on the way. More on potential impacts will be given below.

Other notes: Old Region 6368 rotated onto the eastern limb today. It has been given a region number of 6412. So far, only two spots have been identified, but it is still too early to see any details. The region currently sports a minor HHX spot configuration, but its accumulated area so far (900 million square kilometers) suggests that this region is still at least moderately large. Early indications seem to suggest that it has decayed into a more stable configuration. More will be known when the rest of the region becomes visible over the next 24 hours.

GEOMAGNETIC STORM WARNING

Today's major class M5.8/2B flare is expected to have at least a moderate impact with the earth. An interplanetary shockwave is expected to reach the earth between 18:00 UT on 11 December and 11:00 UT on 12 December. Geomagnetic activity is expected to reach at least active levels over middle and low latitudes and minor storm levels over higher latitudes. There is, however, a moderate risk that middle latitudes may achieve minor to major storm levels while high latitudes experience mostly major storming. At the present time, the middle-ground is being chosen as most likely. That is, middle latitudes should experience predominantly active levels with some brief periods of minor storming. High latitudes should experience mostly minor storming with brief periods of major storming. More will be known once the impact from this flare begins to impinge on terrestrial activity.

A geomagnetic storm warning has been issued, particularly for the high latitude regions, but encompassing the lower latitudes as well. The magnetic storming is expected to be enhanced somewhat by a favorably positioned coronal hole. The combined effects of the flare and the coronal hole may be sufficient to provide major storm conditions over middle and high latitudes.

The Space Environment Services Center has issued a condition YELLOW alert status for potential PCA activity. The probability for major flares is hovering between 10% and 15% for both class X and proton flares. The probability for further class M-flare activity is steady at 70% for the next 72 hours.

PLANETARY 10-DAY GEOMAGNETIC ACTIVITY OUTLOOK (09 DECEMBER - 18 DECEMBER)

NOTES:
Predicted geomagnetic activity is based heavily on recurrent phenomena. Transient energetic solar events cannot be predicted reliably over periods in excess of several days. Hence, there may be some deviations from the predictions due to the unpredictable transient solar component.

NOTES:

These VHF DX prediction charts are defined for the 50 MHz to 220 MHz bands. They are based primarily on phenomena which can affect VHF DX propagation globally. They should be used only as a guide to potential DX conditions on VHF bands. Latitudinal boundaries are the same as those for the HF predictions charts. For more information, request the document "Understanding Solar Terrestrial Reports" from: "std_oler@hg.uleth.ca".

-- MAJOR SOLAR FLARE ALERT --

DECEMBER 11, 1990

Flare Event Summary
Potential Impact Forecast
Revised Prediction Charts
--> Geomagnetic Storm Warning Update <--
--> High Latitude Auroral Storm Warning <--

MAJOR ENERGETIC EVENT SUMMARY

Solar activity was high today. A major class M6.5/SB flare occurred at 20:52 UT on 11 December, but was not accompanied by any significant radio emissions. The flare was associated with Region 6402 and occurred at a position of S11W80 very near the western limb. This flare was difficult to optically correlate since at that time, Regions 6397 and 6387 were all reported to be flaring during the event. It was later concluded that the event originated from Region 6402 and was rated as a very small bright subflare at optical wavelengths. Although this event did reach healthy x-ray levels, it will not have a terrestrial impact with the earth.

A barrage of M-class flare activity occurred from the many active regions visible on the solar disk today. Most of the activity occurred in the northwest quadrant where most of the mature active regions are developing. A total of five M-class flares occurred today, all class M1 flares except for the major class M6 flare.

The elevated flare activity has produced numerous SID/SWF's. A total of five SID's were numbered today, two of which have been confirmed as producing shortwave fades. The first confirmed SWF occurred at 20:46 UT and lasted until 21:56 UT. The second occurred at 22:55 UT and lasted until 23:40 UT. Both of these confirmed SWF's affected frequencies up to 13 MHz. The probability for further SID/SWF's is high for the next 48 hours, when several of the active regions responsible for the recent flaring should rotate beyond the west limb.

The probability for M-class flaring is 70% over the next 24 hours. The probability declines to 65% for the 48 hour period and down to 60% within 72 hours. The decreased flaring probability is in response to the disappearance of the major active regions beyond the west limb.

Old Regin 6368 appears to be relatively stable. It is large, however, and the trailer region has not yet fully rotated into view. The trailer region contained the magnetic delta configurations which could have spawned major flares, but didn't. Analysis of this region is of relatively high priority, considering the complexity that this region attained when it was last visible several weeks ago. More will be known within the next 24 hours. So far, however, old region 6368 is only listed as containing one large H-type spot and appears to be stable as the models suggested.

GEOMAGNETIC STORM WARNING UPDATE

Additional analysis of the data from the major flare of 10 December indicates that the interplanetary shock wave will likely not reach the earth until the mid or late part of 12 December. Current projections estimate impact between 10:00 UT and 24:00 UT on 12 December, corresponding to a planetary shock speed between 770 and 630 km/second. Geomagnetic activity is therefore not expected to increase until the mid to late part of the UT day on 12 December.

The magnetic storm warning is continued particularly for the high latitude regions. High latitudes should experience at least minor storming with a risk of periods of major storming. Middle latitudes are still expected to remain mostly active with a risk of periods of minor storming. A slight risk still exists for major storming over high and middle latitudes, although it looks as though the activity at middle latitudes should remain confined to K-index values of 4 and 5 (corresponding to mostly active conditions with periods of minor storming). The effects of a well positioned coronal hole could also enhance geomagnetic activity, particularly on 13 December.

HIGH LATITUDE AURORAL STORM WARNING

An auroral storm warning has been issued for the high latitude regions for the UT day of 13 December. Auroral activity over high latitudes could reach high levels on this day. Middle latitudes are not currently expected to experience any auroral storming, although activity should reach at least moderate levels over the middle latitudes. A slight southward expansion of the auroral oval is expected on 13 December, which may place some northerly middle latitude regions within the auroral zone on the evening of 13 December.

Overall activity is expected to decline to mostly unsettled levels by 14 December.

The following forecasts have been revised to account for the new data which has been received. The previously revised prediction charts are still valid but will not be quite as accurate as the following revised predictions. Use the following prediction charts where possible.

NOTES:

These VHF DX prediction charts are defined for the 50 MHz to 220 MHz bands. They are based primarily on phenomena which can affect VHF DX propagation globally. They should be used only as a guide to potential DX conditions on VHF bands. Latitudinal boundaries are the same as those for the HF predictions charts. For more information, request the document "Understanding Solar Terrestrial Reports" from: "std_oler@hg.uleth.ca".

If you can find one of the old Brown Brothers Machine paddles, grab
it fast. It's much nicer than a Bencher. I'm a lousey CW operator
myself, but a friend of mine works CW mobile exclusively. He finds
a keyer difficult to use mobile. He uses a BBM paddle as a straight
key. He says the side to side motion is much easier to control in
a bouncing truck than a regular key. He has the paddle mounted on
the center console. He also advises a radio with a dial lock and not
to use too narrow filters in the receiver.

Of course, if the rumor WERE to be true, it would probably be for the reasons following: 1) Code Waiver for disabled brouhaha - removed completely, and 2) Bitches about we want Novice to STAY, when FCC wants to have no more license classes (communicator should not cause more classes) answered by removing TECHNICIAN class instead, as all current Techs would be General Class under the rumored plan - grandfathered, just assumed Techs have Gen privs, no new techs issued.. simple - of course, being too simple, it's probably not gonna happen...

I'm wondering what the FCC considers as covering what for NPRMs. About a year ago there was an FCC report (I have a copy at home on my AT somewhere) that among other things, recommended that all testing to be fair should have a direct relationship to privlidges granted. While the Novice enhancement removes a gross unfairness in the light of that document by making the TECH license easier, there still are a LOT of original pre-enhancement TECHs out there but at 5wpm. The only thing keeping them from GENERAL privlidges was the increase in code speed. Since there is a LOT of license enhancement from TECH to GENERAL in phone and other privlidges the code test for only a small increase in code privlidges coupled to that might be the target for change.

It really depends on what the FCC REALLY does, not what is rumored.

>amateur radio operator.

I've seen the exact opposite argument in QST, suggesting that we use the
term "HAM" because people have a better recognition of who we are when
we say "HAM" rather than "amateur". QST said that many people equate
an amateur radio operator with a pirate radio station. They're not a
PROFESSIONAL radio station, right? So they're AMATEURs and therefore
a Pirate.

Oh, well.

>2. Why .amateur instead of .ham? It has been pointed out in discussion
>that "ham radio" is primarily an American term, and carries little
>meaning outside the US.

Since some people seem to have doubted this, let me give my view of the situation:
1. Hams/amateurs from non-Ennglish speaking countries generally understand the term, since English has become the international radio language. "Amateur" is used in any language (or rather the corresponding word).
2. Non-hams from non-English speaking countries generally have no clue.

>1. rec.radio.amateur or rec.radio.amateur.misc?

My opinion on this is since the ".misc" doesn't add anything to the meaning, is should be dumped. Besides, doesn't it go against the idea of a hierarchial naming convention?

>2. rec.radio.amateur.packet or rec.radio.amateur.digital?

Remember, there are more to digital hamming than packet. If you want to discuss packet radio (that is, ARRL AX.25), then go with ".packet". If you want to include discussion of Baudot (RTTY), AMTOR, and the like then go with ".digital".

Throwing my own two sparks into the fray, here's what I'd like to see:

rec.radio.amateur

Discussions about amateur radio, e.g. technical *and/or* legal.

A large percentage of any legal discussions will be technically based. It will be hopelessly confusing to separate the two and will result in endless cross postings. Since we as hams are supposed to be using minimum power necessary to communicate, we should not create a .legal group.

rec.radio.amateur.qst

Announcements only for special events, AMSAT, shuttle, prediction bulletins, etc. These are important for everyone and should not be buried in the discussions.

rec.radio.amateur.packet

Same as before.

rec.radio.amateur.swap

Same as before.

Mark

You know, the old FCC just might do something like this, considering the ARRL's lawsuit over 220, just out of sheer oneryness. It could be the best thing to happen to ham radio in years, provided that they replace the defunct elements 1B and 1C with a more rigorous set of theory elements.

A possible scenario would go something like this:

1. FCC eliminates elements 1B and 1C. Pre-"novice enhancement" technician licensees are grandfathered to general, having had passed old element 3 (now 3A and 3B).

2. Exam elements 3B, 4A, and 4B are revised to place greater emphasis on theory, rules & regs, etc. This provides a graduated upgrade path on the basis of technical skill and knowledge. All upgrades are based on the 'improved' theory elements.

I have a feeling that the OFN will fight this like the plague. (OFN = Old Fart Network :-). I think that eventually we might see only three license classes:

1. No code VHF only: 6 meters and up, full privledges.

2. Novice type license: 5 wpm CW, limited HF privledges (but expanded from what they are now), limited power (250W max), limited VHF privledges (6m, 220, 440, 1296, 2304 MHz bands, restricted at least 1 MHZ away from weak signal subbands).

3. Full amateur license: 5 wpm CW, all HF and VHF privledges.

>on each pass. Anyone who knows for sure, please let me know what's going on.

A new number is assigned for each connect, but it doesn't go into the "confirmed" log if it is a dupe. And if you don't ack the QSL and disconnect packets it is not counted as confirmed.

>Aloha, hope everyone that tried managed to get through to STS-35!

I got connected but then downlink became too noisy to copy my QSO number, another local station copied it (#667) but it won't be in the confirmed log since I didn't receive and ack the QSL and disconnect. Oh well.

True if you're talking about the high end of the band. The CW end is much better behaved.

I have used an old Vibroplex (non-iambic) key paddle mobile. I mounted it on a piece of two-by-four and taped it in place angling upward just in front of the passenger seat cushion. This way, I could rest my wrist on the cushion and send. (Paddle taped solidly in place.)

>law without having to go through every piece of legislation that the
>FCC is involved with? ...

It's in Part 15 of the FCC Regulations, available from the Government
Printing Office in DC. Briefly, in a number of frequency bands
(including the FM broadcast band), unlicensed transmitters are legal
so long as they don't cause interference to the allocated users of
the band and as long as they meet certain technical requirements.
As I recall, you can either 1) limit power to 100 mW and keep the
antenna below a certain size, or 2) keep the radiated field strength
below a specified microvolts per meter.

Hi, Scott.  Long time no hear!

I have used rustoleum on the joints and hardware with good success.
The antenna does look kind of odd with patches of grey primer, but once
it's up in the air, it's not too noticeable.  I have even considered
painting the whole thing with grey primer, overpainted with splotches
of robin's-egg blue to camouflage it like a WW-II Spitfire!

I always recommend new hams start with a used rig.  It's plenty good
enough to get your feet wet.  After you've had some on-the-air experience,
you will have decided what features are important to you, so that when
you do buy a new radio, you have a better chance of getting what you
want.  You should then be able to sell the used radio for nearly what you
paid for it (since you bought it used.)

I thought that the limit was 500mw, but maybe that has changed now. It's
not just FM. I think it covers anything (am, fm, tv, whatever).

Frankly, our PR is very bad. Most achademics have a low view of radio
amateurs, or at least that is the impression I get. It is not a good idea
to pass on the information you are a radio amateur in some circumstances.
I think CB is to blame for this, at least in the UK.

>ANY news.
This is very true. It is difficult to get any un-moderated groups, and the
undergraduates do not have access to the majority of news services. Also
the finance is of great concern. Hence, we do not see most of the Rec.*

articles here, simply as they are deleted when new stuff arrives. Every
Monday, somthing like this happens

130 unread articles in newsgroup Rec.ham-radio read(y/n)

skipping unavailable article

Article XXXX of newsgroup Rec.ham-radio (15 left),

r somthing like that. ie we lose 115 articles and only see the last 15. I
suspect this is common to many educational sites.
UKC does not pass on any of the alt.sex or alt.drugs newsgroups (not that
I would want to read them). Those who complain about people posting
uuencoded files to the net might consider that many UK sites do not have
any easy FTP access to overseas accouts. Remember, we are now a third
world economy (nearly)

Can anyone tell me just what the "ADD" key does on the DR-590 front panel?

The manual says something about "added scan", but no specifics and I can't
seem to find any functionality associated with it.

One useful statistic is to conduct such studies with BOTH types of systems.
It tells you just how many people "know" they are going over the speed limit.
I've seen it done. The numbers are quite surprising.

If you read the law, you can not be convicted on the evidence of fingerprints for a felony. That is SUPPORTING EVIDENCE. If all they have is fingerprints, you're free. If not then, on your first appeal.

Besides, in photo radar, who is to say there was no interference, not jamming by another vehicle (a common practice done by two individuals in NJ to PURPOSELY make innovent individuals get outrageous tickets they fight in court), or other conditions that may make the unit not lock correctly.

In most states, police have evolved POLICIES that they do NOT use autolock or alert modes, and a lot of new RADAR equipment now comes WITHOUT those features. The reasoning is, from police policy standpoint, that the OFFICER must FIRST observe a car exceeding his judgement of speed, then use the RADAR to VERIFY that fact and obtain an accurate reading.

Photo radar goes against police policy.

Your goals and requirements are reasonable. Get on 10 phone as soon as you can. With the excellent band conditions lately - these are going to be the good-old-days that we'll all be talking about for years to come. But definately don't forget CW. When 10 dies, as it does here at sunset, move on to 15, 40 and 80. You'll find a whole world of new interesting friends to visit with. And in a couple months you'll be ready for the General/Advanced code test.

>

Which brand and type rig is a religous issue. You'll always be able to find someone that thinks rig A is the greatest and rig B is foo while the next person thinks the opposite. Look at them all. List the features. Find some local ham or club and play with their radios. Better to wait a little now and find one you really like. Some rigs to try include the ICOM 735 and 725, Kenwoods TS140 or TS440. Yaesu also makes similar rigs but I'm not familar with the numbers.

>   I think my personal preference would be an LCD display for the frequency, but
>   I am told that it is sometimes better to get an analog tune.

Yes. You want a digital display (LCD). Older rigs had analog displays. Some folks may like analog better. Try them both first for yourself.

Since you're into computers and gadgets I suggest a MUST requirement for your new radio be "computer" control. Most new rigs do this.

I drive across Wyoming at night. BOTH hams are usually asleep. THE ranch has the lights out. It's >NOWHERE<. I've never been to Texas yet - I wonder if you can drive for as long without seeing any other cars or lights of any kind. (Besides the stars - which can be fantastic.)

> Since I can't use voice on 20m (being a mere Tech), that leaves me with 10m
>and up, none of which have any range at night.

Why say UGH? CB out of the cities is a useful and fun personal communications system. Which is exactly what it's meant to be.

>

>The Uniden 2510 and 2600 and the Radio Shack 10m rig seem to be the only real options here. Someone (kd6th@kd6th.nj.usa) has posted mods for the 2510. Will this work for the 2600 as well? If so, I'll probably get a 2600 since it has a few bells and whistles that the 2510 doesn't have. I'd like to hear from owners of all three radios (and any I've missed) on their likes/dislikes.

I have a 2510 and it's been converted to receive CB. I suppose it'll transmit there also if ever needed. It gives be both 10 and CB in a single box which is fantastic. Anything that reduces the number of wires and antennas really helps. (I didn't have any trouble with the number of radios until I started running packet mobile - :-)

The Radio Shack rig is similar but doesn't have AM. That won't help you on channel 19 where all the trucks and other road traffic is.

I haven't had any experiece with the 2600.

>
>Also, someone posted an article on how to make your modified ham rig resemble a legal CB on the air. Had some useful information on microphones and other things. I would appreciate a copy of that information if someone has kept it. (My goal is to keep a low profile if I do choose to modify a ham rig.)

The 2510 does have a hi/low modulation switch. Using low modulation and an antenna tuned for 10 (bad match on CB) you'll have a signal that won't be much different from a well tuned up CB set. Sorry, but I didn't keep the prior posting describing CB radios.

>
>[Aye Captain, shields on high]
>

The best option, as was rudely put in another response, is to upgrade. With access to all the ham bands you'll have no end to the folks to visit with.

Another option, which could actually help you upgrade, is perfectly legal and lots of fun. You already have CW privileges on 80, 40 and 15, of which 80 and 40 will both be open most of the night. Why not try CW? You'll be on the air, the miles will pass faster and your code speed will increase. Even better, a mobile CW signal will work much better than a SSB signal for the same power due to the lousy mobile antenna systems.

Also, while it's possible to modify a ham rig for CB use, the reverse is both possible and legal. The addition of some extra crystals or other frequency generation magic will put a CB on 10. Thus giving you a single rig that works for both bands. Some folks may say that a CB set with added frequency range is no longer legal on CB - but, if done carefully, it sure isn't going to hurt anything.

Good luck. Let us know what you come up with and how the holiday drives across Texas turn out. This year my folks from Montana are coming down to visit me in Colorado - so no Wyoming star gazing trip this winter for me.

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

One thing about this keyer which is neither in the manual nor the QST
article is that it uses what Curtis Electro Devices (maker of the 8044
keyer chip) calls "B" timing. This characteristic automatically adds a
character of the opposite kind when the paddle is released.

This is the standard for most commercial memory keyers.

The stock 8044 keyer chip, which my old home-brew keyer used, did not have this
feature. It drove me crazy until I figured out what was going on! Now, I
really like the "B" timing better.

> progress?

I see. Ham-radio is a rather specific term, which is probably pretty
well known worldwide. Amateur is a generic english word, which means, as a
first approximation, 'not professional'. Since dictionaries seem to mean
'final arbiter of all' to you, here are quotes, from The Living Webster:

"Amateur: One who cultivates any art or pursuit for the enjoyment of it, instead of professionally or for gain, sometimes implying desultory action or crude results." There is no mention of radio in this definition.

"Ham: (under a section of the definition labelled 'radio') a licensed operator of an amateur radio station."

So, ham when applied to radio specifically determines the subject. Amateur when applied to radio implies ANY non-professional activity including radio.

Keep in mind, I am reading this as someone who does not know what ham radio is, does not know English, and looks every new word up, which is the basis for your claim for the change being good. Only those worldwide beings who do not know what ham-radio is would benefit from the name change. Sadly, if they don't know either ham or amateur, the dictionary does not define radio.amateur as well as it does ham-radio, and they will not benefit. They lose. This is a step backward.

Not an unreasonable occurence: "Hey, I run a pirate station in Greece, but I don't do it professionally. I am an amateur user of radio, but I am not a licensed amateur radio operator. If I saw radio.amateur and looked it up I would guess I fit in. If I saw ham-radio, and looked it up, I would know I don't."

Oh, then read the charter. That will clear things up. Well, the current charter clears things up, too. So, if reading the charter is the primary way of identifying groups, there is no reason to change.

> Merriam-Webster defines real as: Authentic, genuine, actual and true.
> Progress is defined as: To develop a higher, better or more advanced stage.
> How can you state that it is not progress of ANY kind? Are your criteria
> different than that of the international dictionary? If so, why?

Which section of your dictionary defines the name change of rec.ham-radio as a higher, better, or more advanced stage? I happen to use the same definition of progress as Mr. Webster. I just realize that the name change is not a higher, better, or more advanced stage. It is just different. Since it is not a h, b, or mas, it is not progress. That is how I can say it is not progress of ANY kind. A chickadee is not a cat, so I can say a chickadee is not ANY kind of cat.

And, as Mr. Webster has shown above, renaming will actually broaden the definition of the group instead of clarifying it. This is a step backward.

> >   Since there was an affirmative reply to the post of one site against
> >it, then there are obviously TWO sites. If there are TWO, then there are
> >probably more.
>
> Maybe not, and if so, so what? The majority consensus will prevail as define
> in the net rules established for creation of new groups. Two sites MAY be 2
> no votes if they even take the time to vote.

That comment was in the context of a claim that I was the only objector. I pointed out that that statement was false. It shows the trend in the arguments of the proposal supporters to make proveably false statements. You have not proven it was true, so you argue into the wind. It goes with the provably false argument that this change would involve editing only one file.

> Since you obviously are not up to speed on group creation, removal etc, a short education is in order for you. Many sites have AUTOMATIC new group creation enabled. Those that do not, require a simple intervention by the news administrator.

Not all sites require a simple intervention. You make unwarranted assumptions about the world. For someone at an easy site to claim that it is easy everywhere is an insult to those who are at the difficult site.

> I am the news administrator at this site, so don't try to snow me with how difficult this all is!

You are an admin at an easy site. I am an admin at a difficult site. Don't try to 'educate' me as to how easy it is, cause it ain't. The only snow here is from those who have easy sites and don't like hyphens.

> > The only real change is the addition of a .rules or .legal subgroup,
> > which could be done WITHOUT any other name change.
>
> Wrong. See defininition of "real" above.

My entire statement is correct. Moving an entire tree enmass from one parent to another involves no change in the tree. This name change is exactly like mv'ing a directory that has subdirectories from one parent to another. Nothing in the children changes. Only the full path changes, but if you have trouble with files being in two children at the same time, mv'ing the parent directory will not fix that.

> Sure it COULD be done without any other changes.
> If you are not going to change something with the goal to make it as near perfect as something man-made can be, why bother at all?

You are saying the renaming rec.ham-radio will make it as near perfect as something man-made can be? Then those who took part in the Great Reorg, who created rec.ham-radio, did not do their best? Of all the problems people are having with ham-radio, this solves NONE of them, and makes it less specific from the name what the group is about. Take two steps back.

> Do you approach all your projects with an attitude of why bother to do my bes

That is just silly. Claiming that renaming rec.ham-radio is the best is just silly. It is one of those unsupportable, unsupported allegations that keep getting tossed into the discussion.

> > Your post is yet another wild claim of perceived benefit with no
> > justification provided, and it the only utter nonsense here. I have asked
> > several times for a real justification for this change, and NOBODY has

> >answered. The only "reason" so far is "it's a new name". So what?
>
> The JUSTIFICATION was stated at the beginning of the reply as well as by numerous other posts on this subject. The only wild claims were made in your emotional original post and reply.

I did not make the original post. Are you sure I am who you think I am?

The only justification given has been that 1) it makes the name better, and 2) it makes the name less archaic.

1) was pretty well shot down by Mr. Webster. 2) is a personal opinion, and has not been justified. Archaic is not bad, per se. "Ham-radio" (as a hyphenated word) does not match any of the bad definitions of archaic.

> I've seen some negative posts in the last 4 years in this group.

Did you see the reply form Paul to my alternative proposal? That was pretty negative, and certainly more negative than anything I have posted. I keep asking for the reasons for the change, and I keep getting the same unsupported claims and subjective analyses of how bad the name is. Nobody can supply a reason that makes the effort worthwhile. I took those same unsupported claims and generated a better proposal, one that included groups for other amateur users of the spectrum (some that were explicitly asked for in responses to the CALL but were ignored by the original authors), and specified the name better, and got a two line pot shot in return. That is being negative.

> You should be proud to be right up there with the worst of them, providing
> NO rational basis for your claims.

I was making the assumption that those I was talking with were cognizant enough to realize that the whole world is not C news and UNIX, and that some sites are more difficult to manage than others. That they realized that 'difficult' and 'hard' are highly subjective terms, and that what they perceive as easy is not easy for everyone. That different procedures that achieve the same results at different places are not necessarily all equivalent as to difficulty. That, perhaps, one person saying 'this is not easy' would gently remind them of these facts, without having to provide crossed-t's and dotted-i's and counts and statistics and ad nauseum.

However, I see this belief is unjustified.

Not every site in the world runs UNIX and C News. There are alot of VMS sites. There are alot of IBM VM/CMS sites. There are a lot of Xenix sites. There are alot of PC sites. There are alot of 'you name them' sites, that are not UNIX and not C news.

Not every site in the world feeds everything. Some sites take only what they want. Some just physically couldn't handle the load. Some have management limitations (cf. the recent post re: sci.ham-radio in news.groups) that prevent full feeds. Some are allowing news as long as it takes no work to maintain, or on a tentative footing (cf: the post from the gentleman from the University who is in this situation). Most sites provide feeds to others on a free basis. That means that any changes requested by the feed fall at the bottom of the stack.

'Hard' and 'easy' are subjective terms. That means what is hard is very much dependent on who is doing it. What is easy for you may be hard for others. If this were not true, then we would all be UNIX gurus, and make millions playing professional sports. A friend of mine is struggling with an HP printer. I could set her up in about 5 minutes, but this is for work and I don't work there. It is hard for her. If I said 'oh, that is easy', that would be rude and insulting.

Since not every site in the world is the same, they don't all do the same things in the same way. Some of the equivalent procedures may be easy at your site, and not easy at another. Compare this with computer languages. Complex arithmetic in FORTRAN is easy. Complex arithmetic in C is not so easy. Both come out with the same results.

> You are guilty of the very same error
> you accuse me and others of making.

You are guilty of ignoring the variance in the world. I am guilty of assuming you would know there WAS variance.

> This is an extremely inaccurate analogy.

It is extremely accurate. Renaming rec.ham-radio will obscure the fact that it is for ham radio, just like rec.radio.noncomm seems to mean ANY noncommercial radio. Renaming NYC to SBN will hide the fact that it is in NY. Renaming r.h will not fix the problems with cross posts, or anything else. Renaming NYC will not fix the roads or the potholes or the crime. In both cases, you wind up with the same thing under another name.

> I never claimed that the name
> change would provide a solution to this groups problems. Maybe next time

<<important plot element follows>>

If the change does not provide a solution to this group's problems, then WHY DO IT? If it ain't broke, don't fix it. Change for change' sake is not progress, it is chaos.

> you should spend as much time reading as you do wasting bandwith with
> inaccurate analogys, erroneous and inflamatory claims.

I would suggest that you think about what I write, and perhaps you will catch the analogies and understand the claims the first time, instead of making me dot all the i's and waste all the precious bandwidth explaining everything twice.

   Not all groups deal with ham radio.

   Universities, in particular, have shown increasing concern about
providing USEnet news to their students/staff. They are concerned about
free speech issues and liability for racist or sexist remarks made in
news systems they run. The admins are concerned about the net.flamage
that a student/staff member can generate by posting things in poor taste.
The PSU admin did not escape the flames when his site was guessed to be
the source of a BIFF post. The admin of the site that sourced an explicit
description of sex between the crew of the Enterprise is probably less
than happy that his site has USEnet.

   If you worry about these things, the easiest thing to do is not carry
ANY news.

Amateurs seem to have a total lack of interest in broadband HF antennas and matchers. Untill recently that also included me. My company maintains an extensive HF system for disaster (earthquake) recovery and has switched from 120 ft. wires with digital couplers to broadband delta loop antennas- with good results. We probably have 180 ft of wire in the loop with 10:1 baluns inserted at the center of the base and at the apex. You feed the loop with 50 Ohm line at the base and the top balun has 50 Ohm cable fed back down to a dummy load. The SWR is flat enough from 2 to 9 MHz to satisfy our 1 KW solid state linears. I realize that there is a couple S-unit penalty, but given the difficulties of erecting an efficient 80m dipole on a small lot, it seems worth a try.

Maxcom took a lot of flack from QST about their matchers a few years back. Has anyone ever built a simple resistive swamping unit and tried it out on 80m? I am going to try the balun idea with some inexpensive 4:1 units to test an idea. I thought a wire run completely around the house under the eaves might be an effective and hidden antenna on 80 & 40m.

To add some credibility to the subject, Collins is advertising a passive antenna matcher with their Spectrum 2000 (I think that's the name) line of HF radios. It is a little more sophisticated and has three passive R-L-C networks that are blindly selected by the radio by frequency band.

Or how about a good way to bring it into the house. I am thinking of drilling two holes right through the wall and using like #12 wire to go through the holes. Any better ideas?

Brian and the rest, what has been suggested here in the form of :
try cw mobile
upgrade your ticket

are both very worthwhile suggestions; both Yaesu and Icom offer excellent mobile rigs (I will leave out of the discussion the rigs without LCD displays because they are practically useless in bright sunlight) which offer a companionremote tuner for a whip, which will resonate 80-10 m, including the WARC bands;
the Yaesu 747 can even be had in a version which lets you remote mount the control panel.

I have used the Icom 725 and AH2 combination mobile, and have over 160 dxcc countries confirmed with it, on ssb. some were easy, some hard... but all were fun, and they wiled away a few zillion hours driving around west texas.

Mobile cw? well, I like it, but it is not for everyone, and I would recommend practicing it a while when someone else is driving first... it is distracting initially, and hard if you haven't mastered the art of copying cw as words.

DRAWBACK: it costs more; lots more (pick up an AEA catalog and see...)
BUT it is well worth it, and will let you use it as base rig when you want to; in that application, I think the tuner will tune a 40'or longer wire to 160m, sothe option of using a longwire at home is there...(of course, avoiding any length that looks like 1/2 wave at operating frequency...).

cheers
DFR

WA2SRQ asks about the iambic feature on the Super Keyer II. I can't find any way to turn the iambic off on mine. This is the first iambic keyer I have used and it has taken me a couple of weeks of solid sending practice to master it. But having done that, I would NEVER go back to a non-iambic keyer. It really reduces the amount of paddle/hand motion. I love it! One other comment: I did not get the hang of it until I read exactly what the iambic mode is, namely that when both paddles are squeezed and released, it completes the character it is on (whether dah or dit) and then follows it with the opposite character. As soon as I realized that and started planning for it, it suddenly started WORKING!! Thus, holding one paddle over while simply tapping the other one takes care of F, L, Q, Y, R, and K, while squeezing does the C. Effortlessly!

In <sifakis@sono.uucp (George Sifakis)> George asks:

>Can I measure real (not relative) Watts using a Heath Cantenna dummy
>load? The thing provides a circuit with a divider (100K in series,
>100 to the ground) plus a rectifying diode in series. How can I read
>a voltmeter connected to that circuit?
>

Let's see-- P equals E squared over R. R is 50 ohms which is the dummy load. An RF voltage is impressed across this R and we can rectify this voltage. This becomes E. We impress E across the two 100K ohm resistors in series, and read the voltage (let's call it X) at the junction of the two (have I correctly identified the circuit?)

To determine P, then, we take X and multiply it by 2 (to get E), square this value, then divide by 50. A 100-watt RF source should give a voltage reading at X of 35.35 volts. To read the power directly in watts, you need a meter with a scale calibrated to the formula.

The meter should connect between the junction and ground, and should have an input impedance of at least a megohm.

In <edg@netcom.UUCP (Edward Greenberg)> Edward asks:

(Re: Another CW Question from A Technician :-))

>>In English this is: good evening old man, thanks for the call. Your signal
>>report is 599. My location is San Ramon, Ca. My name is Jerry. How do
>>you copy?
>>
>I note that lots of exchanges include the HW CPY? on each call. Does this
>question refer to another signal report or an inquiry as to how much of the
>transmission did the other fellow get?

It may be either, or even both. When both ops have reported good signals, say, 599, it probably isn't necessary. Usually, weak signals, QSB, or QRM/N may cause one or both ops to wonder if conditions have changed enough at the other end to cause problems. Or, you may have rotated your antenna to get a better "bead" on the other station and ask. An op may wonder if he (she) is sending too fast (or too slow). I use HW CPY? at the first exchange, and HW NW? occasionally during the ensuing exchanges according to conditions.

It is easy to slip into a habit, and I suspect that many ops just send it out of habit. (It keeps your "Y" sending in practice, if nothing else) :)

I am trying to obtain copies of software for the Macintosh to help my wife get her amateur ticket. I have seen references in the past to MacMorse and I am very interested in this program. Are there other code practice applications available for the Mac? I have also read about the HyperCard stacks which allow practice of the various theory elements. These too would be helpful.

I would appreciate an E-mail response from anyone who knows how to get copies of these applications. Thanks for the help and Happy Hollydaze.

Did every amateur station in the country go
>into mothballs "for the duration" ?

In a word, YES.

Amateur radio operations began to shut down worldwide as the war began. By 1940, most of Europe (and Canada) was off the air, and by 1941 little international operation was possible. After Pearl Harbor, USA hams were off; operation resumed some time after V-J day.

Remember why we still have our frequencies: Amateur bands are in fact "the RESERVES" that the military can "call up" in time of major war. During WW II, HF bands were the workhorses, so the military built all those "command sets" and other radios that conveniently were converted to ham use after the war. Since WW II, the military has sided with hams against other encroachments onto our bands. Not because they like us so much, but because they know we'll be off the air the moment they need the bands.

I'm not THAT old, but I've read a bit about it, and even once had some 1940's QSTs that were discussing what to do after the war ended and the hams could get back on the air.

Read what I wrote. If you do _NOT_ want rec.ham-radio.legal ... You keep missing the NOT part of the sentence. You are not authorized to drop random words in other peoples arguments just so you can make whatever point you want to make. If you do NOT drop the NOT, there is no contradiction.

If you created .legal in rec.ham-radio, anyone who does not want it has 0 (zero) work to do. No changes in feeds, no changes to active files. This is easy.

If you move rec.ham-radio to rec.radio.ham, and add .legal there, anyone who does NOT want .legal will still be required to make the changes to get rec.radio.ham. This is positive, non-zero effort. You claim it is editing one file. That is demonstrably false. Even so, it is one chance to mess up what is already there.

As the end result, the structure of the ham radio group would be exactly the same IN EITHER CASE. There would be a top level group for general discussion, a swap subgroup, a packet subgroup, and a legal subgroup. This structure would be the same if the group were under rec.radio or directly under rec. The management of growth would be the same. Identical. No difference. Zero (0).

The only difference is in the work required to make the changes to move it all under rec.radio. Since there will be no difference in the results, why go to the effort?

> There IS however a status associated with being archaic, and I'd rather that
> ham radio wasn't stuck with said status.

So the entire argument in support of moving rec.ham-radio is that you don't like hyphens. Let's all mix everything about just to keep Paul from having to see a hyphen.

> The noncomm refers to noncommercial broadcast radio. Read the charter. With
> the exception of certain legally dubious operations, ham radio is not
> broadcasting.

And since this is a reorg, what stops us from changing the charter? Especially if it leads to a better solution to the problem. You ignored the ability to do that in your pot-shot post. Amazing, isn't it, but EVERY idea I used in the alternate proposal was based on arguments provided by supporters of this one.

And even without a charter change, USEnet is anarchy, remember?

> Incidentally, PBS is NOT running advertisements. Note that the sponsorship
> messages don't mention specific products. (One did once and the FCC got
> very angry, very angry indeed.)

"Jeff Smith's Frugal Gourmet Cookbook is available for $24.95 by calling 1 800 555-1212." Can't get too much more specific than that, can you. Have you also noticed that some commercials on commercial TV are designed with the sole intent of keeping a company name in your mind? Borden did this for a while. Chrysler, I recall, had a bunch where they didn't hype any one car, just that Chrysler was back, better than ever. Infiniti had a series where they didn't even have a car, just seasides and scenic views -- and the Infiniti logo. No difference from showing me the XYZ company logo and saying "underwriting provided by...". Or telling me "... Syracuse China, manufacturer of fine china in Syracuse for 57 years."

And, yes, there was an experiment several years ago, approved by the FCC, testing adverts on PBS. It was just a few stations. Part of the fallout, after pressure from PBS's, was that it is now ok to use company supplied graphics.

> I'm sorry, but you've consistently overstated the difficulty in both actions
> to be taken, and the number of sites that will have to take those actions.

No, I'm sorry, but you've consistantly overstated the benefits of this change. "No benefit" has been dramatically inflated.

By all means, we need a new subgroup for rule pondering and debating. Add it. It can be added with NO other changes, with less effort, and with the same results -- barring the hyphens.

Last year, I know that someone had put together a server that supported a whole bunch of mods files. Does anyone know where it went? Is it FTPable?

Well, I can't argue with a working system!

I guess my telecom background is showing -- I've obviously been spending too much time reducing buffer delays in my rate converters ;-)

One advantage of ham radio-style full duplex is that there isn't a two-wire-to-four-wire conversion taking place at each end (the telephone "hybrid" function). This eliminates the complication of having to deal with the echo caused by imperfect line terminations at the hybrids (and in the in-line analog repeaters). This echo is probably the driving factor in the delay time specifications I work with.

This is good news to hear. It makes it seem much more practical to send real-time voice hither and yon via the packet network!

Has anybody on this newsgroup worked 3W4DX? I had the
pleasure this morning on 40m at about 0620 Pacific time (1420z).
He was operating non-split on 7005. Viet Nam seems to be getting
more common---does anybody have info from the callbook on how many
hams are premanent residents now? I thought most of the 3W calls
belonged to visiting hams.

>   This is a problem with alt. In one breath you differentiate USEnet
>from alt, and in the next you don't. Be consistent.

My references were extremely consistent. Flagrant mkgrouping is occurring
in ALT. alt.swedish-chef.bork^3 is an example of a group that violates the
hierarchal structure. No contradicion there, _for the purposes for which the
definitions were used_.

>   No, read what I wrote. If you do NOT want rec.ham-radio.legal, you
>need do nothing at all. If you do not want rec.radio.ham.legal, you will
>still need to mangle the news feeds to get rec.radio.ham. There is no
>contradiction here.

Wrong. If you want rec.ham-radio.legal, you have to manually mkgroup it, since (by your first statement) people have turned off automake to handle the alt shotgun. Otherwise it'll end up in junk. That was the contradiction.

>   In your opinion. Above you say there is no justification for the
>status of ham-radio being at the second level. Here you say there is no
>status. This seems to be a contradiction.

Logical hierarchy and "status" are not necessarily isomorpic. For example, do names that begin with "A" have more status than those that begin with "B"? There IS however a status associated with being archaic, and I'd rather that ham radio wasn't stuck with said status.

>   Of all the rec.radio, ham-radio is supposed to be the least
>commercial. Even PBS stations are running adverts these days ("This
>program was funded by ..."). So, we are more noncomm than noncomm. The
>noncomm name fits us better than those who are there now.

The noncomm refers to noncommercial broadcast radio. Read the charter. With the exception of certain legally dubious operations, ham radio is not broadcasting.

Incidentally, PBS is NOT running advertisements. Note that the sponsorship messages don't mention specific products. (One did once and the FCC got very angry, very angry indeed.)

For the vast majority of sites, the name change will involve only editing in the new names and removing the old (and this assumes that the mkgroup hack isn't finished by then). No change in feed will be necessary, as again, the vast majority of sites that receive rec.ham-radio.* also receive rec.radio.*.

I'm sorry, but you've consistently overstated the difficulty in both actions to be taken, and the number of sites that will have to take those actions. I say this having managed several sites (marque, a few ihnnn, shasta) over the past five years or so. I'll be the first one to admit that there are people who have been around here one heck of a lot longer; those that I know of, I've consulted, and they tend to agree with my assessment. That's also the purpose of a CFD.

The split we've proposed took in a number of concerns, the biggest of which was the info-hams mailing list; we split off the legal discussions instead of the technical discussions to better meet the needs of that community. We're currently evaluating some of the other proposals we're seen (the "amateur" mapping seems likely at this point).

Anyone having a CORRECT list of Cyrillic morse code??

In the ARRL handbook I've found a list that just contains pronounciation
"LETTERS" corresponding to each cyrillic letter. Some "errors" is obvious,
or are they not?

The cyrillic "B" is set out at V, but lined up with .-- which is W. Correct?

```
The cyrillic | | |  is set out at J (pronounciation) but lined up with ...-
             +-+-+
             | | |      Is this correct?
```

The |-O letter is lined up with ..--

The bI combination is set out at the SECOND I, but lined up with a -.--

```
And What about | | |    ?  Set out as SHCH, but lined up with Q?
               +-+-++
                    |
```

Does anybody have any official papers? Or at least references?

Takelr|,

Magnus

Couple of interesting facts: Horowitz is also W1HFA and at one time held the record (he claims :-) as the youngest Ham with a mention in QST (must be in the late '40s or early '50s sometime). He is also the main brain behind Project META, a Planetary Society sponsored search for extraterrestrial intelligence, using one of Harvaarhd's radiotelescopes.

Very practical (and absolutely *crazy* :-) fellow, considering that he is a Physics professor at Harvard and was a by-product of Purcell. One also sees his mug on some NOVA programs, the ones that talk about SETI. In addition to SETI, also known to work on room-temperature detection attempts of the monopole; don't know if he has given up on that yet :-).

> ...

><> Larry Lippman @ Recognition Research Corp., Clarence, New York

An OPEN NEUTRAL line in house wiring can produce intermittent "power
surges" whose cause may not be immediately obvious:

The Neutral wire is the center tap of the 230-volt pole transformer
secondary winding. As previously posted, neutral and ground wires
should be connected together at only one point.

With neutral wire intact, loading on one side of the 230 does not
affect the other half; the 230v looks like two independent 115's:

```
_____      ______________              ____      ______________
HV   ) || (              |             HV  ) || (              |
     ) || (    115v     10 ohms             ) || (    115v     10 ohms
     ) || (______________|                  ) || (______________|
     ) || (              |         =        ) ||  ______________
     ) || (    115v    100 ohms             ) || (              |
   __) || (______________|                  ) || (    115v    100 ohms
__|_                                      __) || (______________|
\ \ \                                  __|_
                                       \ \ \
```

If the neutral is open or resistive, then loads on opposite sides of the 230v are in series:

```
----
     ) ||  ______________
HV   ) || (              |
     ) || (            100 ohms     115v
     ) || (__         ___|
     ) || (              |
     ) || (            100 ohms     115v
     ) || (______________|
   _ ) ||
  |
__|_
\ \ \
```

Everything works fine as long as both 115-v legs have equal loads but if one leg is heavily loaded and the other is not, the 230v will divide between the high and low resistances according to Ohm's Law. The high-current device gets too little voltage, and the low-power device gets TOO MUCH! Both may malfunction or be damaged.

```
-----
     ) ||  ______________
HV   ) || (              |
     ) || (            10 ohms        21 volts
     ) || (__         ___|
     ) || (              |
     ) || (            100 ohms      209 volts
     ) || (______________|
   __) ||
__|_
\ \ \
```

If this happens, a "surge suppressor" is about as useful as a plastic Jesus on your dashboard! It is a common problem in buildings which have aluminum wiring.

If the lights get BRIGHTER when the refrigerator starts, or your computer or stereo blew up when the electric heater came on, suspect an open or resistive neutral.

Nntp-Posting-Host: thesis1.hsch.utexas.edu
Originator: jmaynard@thesis1.hsch.utexas.edu

There has been much discussion on this subject, and what started out
as a simple call for a new group has mushroomed into a complete
reorganization of the rec.ham-radio.* hierarchy. This posting reflects
my understanding of the current consensus of opinion on the subject,
and is intended to serve as the basis for further discussion. I
gratefully acknowledge the help of many folks around the net,
especially Paul Flaherty, who suggested the original reorganization
from which this grew; he and I have discussed this posting, and it
carries his approval.

THE CURRENT PROPOSAL:
=====================
The following groups are to be renamed:
rec.ham-radio   => rec.radio.amateur[.misc]

rec.ham-radio.packet => rec.radio.amateur.packet
rec.ham-radio.swap   => rec.radio.swap

Groups will be renamed by creating the replacement group, asking site admins to alias the old group to the new one, and rmgrouping the old group after traffic in it has died down. This method has been shown to work in other hierarchies.

The following groups are to be created:

rec.radio.amateur.legal

This group is intended to contain any and all discussion about legal issues pertaining to amateur radio, including, but not limited to, rules, regulations, laws, and legal actions by and against amateur radio operators. This group is to be unmoderated.

rec.radio.cb

This group is intended to contain discussions related to Citizens' Band radio. This group will be unmoderated.

RATIONALE:
==========

1. Why move the groups at all? The primary motivation is to make it easier for interested people to find newsgroups related to ham radio. The rec.radio hierarchy was created after rec.ham-radio (net.ham-radio before the Great Renaming). It is an inconsistency in the namespace to have groups for similar purposes separated from each other, and that makes it harder for new users to find the desired groups. Further, this allows a change from ham radio to amateur radio (see next topic).

2. Why .amateur instead of .ham? It has been pointed out in discussion that "ham radio" is primarily an American term, and carries little meaning outside the US. In addition, there are negative connotations attached to "ham" that don't apply to "amateur". Some confusion also exists in the public mind about just what a "ham radio operator" is, as evidenced by the occasional "ham operator jams aircraft frequencies!" when the person in question has never been a licensed amateur radio operator.

3. Why a .legal group? A significant part of the traffic in rec.ham-radio is concerned with legal issues. This includes substantially all of the flamage, which has in the recent past included such subjects as whether or not it's legal to order a pizza via an amateur repeater, the proposal to add a class of license that does not require knowledge of the International Morse Code, and the legality of modifying amateur equipment to transmit outside the amateur bands. The new group is intended to move the flames and the long discussions that never seem to get anywhere out of the main group.

4. Why use the name .legal, instead of .rules, .regs, .regulations, etc.? The group is intended to contain any and all discussion about any legal issues pertaining to amateur radio. This includes not just rules and regulations of the FCC and other national regulatory bodies, but also laws affecting hams (such as the infamous New Jersey scanner

law), lawsuits over nuisance issues, antenna ordinances, and the like. .legal is the best description of the intended division of existing traffic I could come up with.

5. Why not a .tech group? There are two reasons for this one. The first is that there's more to ham radio that's non-inflammatory than just technical discussions, and the object of a new group is to move the flames, not run away from them. A .tech group would leave those of us who are interested in more than just technical discussions, yet not in the seemingly endless legal discussions, left to wade through the flames. Second, Brian Kantor, who maintains the info-hams mailing list, has said that info-hams will continue to gateway rec.ham-radio (and, presumably, rec.radio.amateur[.misc]) only, and moving the technical postings off would deprive those on the mailing list.

OPEN ISSUES:
============

1. rec.radio.amateur or rec.radio.amateur.misc? Both have been proposed, and I don't have a strong preference either way. The final proposal will reflect whatever the consensus of the discussion is.

2. rec.radio.amateur.packet or rec.radio.amateur.digital? I do have a preference here, but am willing to change my mind if a consensus is reached that .digital is a better idea.

PLANS:
======

Assuming a consensus is reached by then, I intend to adhere to the schedule I set originally: discussion to run through 31 December, with the vote starting then and running through 21 January. There have been a couple of other reorganizations in the recent past, and I'll follow the precedent they set in regard to voting: an individual vote is required for each proposed group. In addition, I like Kent Paul Dolan's format for the comp.sys.amiga reorganization vote, and will use it for this vote (though I'll put the ballot at the top of the Call for Votes). I intend to count votes automagically with some sort of Unix-type tool (probably awk); votes that the awk script rejects will either be fixed if their meaning is unambiguous, or returned with a request for clarification if not. Other than that, votes will be acknowledged en masse about halfway through the voting period, and not by mail. Votes will be sent to this site, and probably to my account here. (Don't send me votes yet; I can't accept them.)

It looks like we can bring this to a successful conclusion, especiallly if everyone maintains the same high standard of calm, reasoned discussion that's been shown so far. Please post any discussion to news.groups as well as rec.ham-radio, as per the guidelines.

Hi there

I am posting this for a friend, G7EIG who does not have access to the net. I have no knowledge of the subject, so please excuse any mistakes, blunders etc.

Can anyone supply information on the possible sources of PD S/W for SSTV programs for a PC.

Modes required are:
 8sec. B/W
12sec. B/W
32sec. B/W ?? Colour
92sec. Colour

Any information gratefully received with regards to sources, including a brief description on how to access (I read a lot but nil access to sources). Alternately please email direct to me.

Time permitting I will sumarise the info received.

Thanks for your time in reading this plea for help, Colin I hope you appreciate this.

Good DX to you all.
Roy Smith G6GAU   Going forth is easy
RT3141   Going back requires an effort of will,

Regarding the rumor that the FCC will eliminate 13- and 20-wpm code tests: if true, this will render moot the entire issue of handicapped code test exemptions for those two speeds. In effect, everyone would qualify for the exemption.

Perhaps this is why the handicapped rules went into place so quickly?

Phil

NO , Hi SITS (that means he isn't moving) by the side of the road (or
in a driveway, etc) and watches (read that really enjoys watching) the
reactions of the drivers when they see him and the radar gun tracking
their car and realize that their detector hasn't gone off!

A recent discussion of digital voltmeters discussed the topic of RMS, and "True" RMS AC voltmeters. I looked into this a bit and I think the following will clarify the situation.

There are many ways to measure AC voltage, some are more accurate than others.
1. One can rectify the waveform and integrate, but this does not yield RMS, but average voltage. A mathematical correction takes you from average to RMS, which is OK if your waveform is truly sinusoidal.
2. "True" RMS refers to a more refined technique in which a RMS circuit (usually in an IC, these days) actually produces a voltage proportional to the Root Mean Square. This is a somewhat complicated analog circuit, but is more accurate than method number one, which is an approximation from average voltage.
3. With today's fast digital multimeters, it is actually possible to digitize the waveform (up to some limiting frequency) and then compute the root mean square. This is again "true" RMS.

The term "True RMS" may seem a misnomer, but it corrects the use of the term "RMS" for techniques which did not always yield RMS at all, but actually measured average, and applied a correction factor.

I enjoy operating mobile CW and have used a straight key resting on the passenger seat for a year or so with mixed success. Recently, I put together the Super Keyer II (featured in November '90 QST) and am quite happy with it. However, the old paddles I've been using (from an old Ham-M keyer, I've been told) are just too sloppy.

Does anyone have any recommendations on keyer paddles and on mobile CW operation in general. Any advice would be greatly appreciated.

There was no attempted amateur radio contact with the Mir on Dec 4th,
the Soviets said they would be too busy with docking and unloading to
schedule a contact.

Perhaps Musa was trying anyway, unfortunately Ron was not operating
at the time. If so they may have assumed an antenna pointing problem.

There was a contact scheduled for the next close conjunction which would
have occurred today (Tues 12/11/90) but since they landed last night,
that won't take place :-(

I disagree. As long as there is a requirement to learn Morse, we probably won't see much of this. The big attraction of CB is that you can enjoy much of the fun of radio without having to know code (or much of anything else, for that matter).

I do agree on one thing: There will be a lot more people on the bands, making the CW portions more attractive to those who don't like to fight QRM. Those who like to chit-chat on SSB are likely to find it more of a challenge if this "rumor" comes to fruition.

As an interested observer, i am puzzled at the need for the debate.
If it looks like a duck, it walks like a duck, it swims like a duck, and it quacks like a duck, then it probably IS a duck, and as long as everyone recognises it as such, who cares what it is called?
To those of us outside the Usenet domain, the exact nomenclature of sub-groups (and the resultant debate this seems to produce) seems to be so much hot air.

I have used a circuit based on a 741 and a thermistor, but, heres the smart part; instead of using the 741 to drive a transistor which controls the power fed to a heating resistor, i used the transistor *as* the heating element!
I machined a small 'oven' out of some stainless steel stock, so i had a hollow cube with the internal space about 1.5 inches across, then put the whole oscillator circuit inside. Then bolted the heating-transistor to the outside; (if i remember, it was a TI plastic-power type). The temperature thermistor goes inside the box among the oscillator circuitry. Then stuff the whole thing into a diecast project-box & insulate the space with spun-glass wool.
With the temp. regulator adjusted correctly, the xtal stabilised at about 90 +/- 1 degree. Of course, the power fed to the heater is linearly controlled, so you do not get the cycling associated with a traditional bimetal-type thermostat control.

Interestingly enough, there was a write-up on this subject in the December QST. Al is quite right that it is QUITE illegal for reverse patches to be caused by anyone but a licensed operator. About the only way to hook a phone up to a repeater that non-hams can use is to use it as a voice mail box. The caller can deposit the message into the machine and it gets replayed ONLY when a ham on the air asks the repeater if he has any messages.   It probably isn't even proper for the repeater to go into some sort of beacon mode saying it has messages waiting(this being equivalent to the repeater turning on as the call comes in...)

Hello, I am looking for information on controlling the ICOM-751A transceiver via the interface plug on the rear of the unit. Icom sells the EX-309 interface, but I am unaware of any software for it. I hate to pay that much $$ for the interface if it is nothing but a level converter. If anyoune has any info on the Ex-309 or software control of the 751A, please E-mail or post. If there is any interest, I will sumarize to the net.

Thanks, KM4JN

I would like to play around with cloning my ft-470 and i was wondering if anybody out there is currently doing this. if so what format is the data extracted in. as i understand it you put the ft-470 in clone mode by turning it off, turning it on with the f button depressed. all the segments on the display will be on. to unload the data press the up arrow and to download press the down arrow. the data "comes out" of the microphone tip (i believe).

I know that I have seen postings here re the ft411 and cloning and how you can edit tx and rx frequencies frequencies and down load them back into the rig.

Which processor straps must be activated for this operation.

Is a memory map available.

please answer me here and I will compile the results and post it.

thanks.
buzz
wm1w

p.s. yes i am a ham and i do not tx out of band. an ht is simply a very good rf frequency generator that has many uses if i could get just a bit more range out of both the 2m and 70cm sides of the rig. tnx

+
+No; it would not!
+The rules changed a few years ago.
+The current theory test for Technician is different from the test for General.
+Upgrading to General would *still* require passing the *General* theory test!

Ah, but! For those of us that took the *old* Element 3, before Novice enhancement went into effect, the only difference between us older Techs and Generals is that blasted 13 WPM code test that makes up Element 1B.

This would be the most intelligent thing that the FCC could ever do. The ARRL (read: the diehard CW elite) would scream bloody murder, but it may be too late for them to hold back the eventual..we can only hope!

I am in need of accessories for the TS520S.
In particular, I need the 12volt power cord(or just the plug) and a mic that went with it or will fit it. I also would be interested in any other accessories at the right price.

Now that I have a PC in my radio room, I have been having fun setting up various systems to aid in monitoring.

I already have a scanner database for maintaining all the data on local transmitters audible on my PRO-2004.

Well I got to thinking how nifty it would be to have a HUGE UTILITY database of the entire shortwave spectrum. Sort of an online version of some of the books out there (like Grove's shortwave book). One that I could update with my own monitoring info.

I was starting to write the code to maintain the database, lay out the entry and report screens, etc., when I got to thinking....

AM I RE INVENTING THE WHEEL? Surely someone out there in Netland is as much a Utility Nut as I am and has already not only written the software but also has already typed in several thousand entries.

Or not?

I do have such a database that a friend made in PCFILE, but I really would prefer to have it in DBASE III+, since you can make much greater use of the information.

It would be nifty to tune to a frequency, hear an unid'ed signal, and type the freq in and find out who it is. Lots nicer than looking it up in a directory.

Before I begin the monumental task, I thought it would be at least worth a shot in seeing if anyone else out there has started a similar project. Perhaps we could combine efforts.

If responses are negative, I might try converting the PCFILE one to DBASE III+, and will eventually make it available to those interested.

Is such a thing on SIMTEL 20 or elsewhere?

It is a nice cold snowy day up here, the perfect kind of day for such a project.....

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

>for the 2m yagi i suddenly have the rotor pole in the same plane as the
>2m yagi. So what will the rotor pole do to the 2m yagi?

Three possible solutions:

1) Use an insulated mast (broomstick handle, etc.) to the 2M yagi, and run the feedline off the back of the beam (behind the reflector) so that there is no vertically-polarized metal in the middle of the antenna.

2) Mount the 2M yagi in front of the mast, that is, sticking out from the mast in one direction only. This will mechanically unbalance the system, so you might want to use a counterweight.

3) Just go ahead and run the aluminum mast up through the middle of the yagi. If the mast and other metal structure don't happen to be resonant near the 2 meter band, this often works surprisingly well.

Whether it's 'progress' or not is truly beside the point. "Ham Radio" is our traditional pet name for our hobby, and changing our hobby, especially changing its name, to fit the needs of an external medium we use to discuss it is to let the tail wag the dog. Sure we could do that, but the only ones who would want to are the ones whose hobby is 'newsgrouping' rather than 'hamming'.

Law: If it ain't broke, don't fix it.

Corollary: Even if it's broke, I like it that way.

I was away from home from Saturday afternoon until Sunday night this weekend, but I left my packet station on 145.55 recording all frames on the channel.

I'm not sure what time it was when I received them, but, when I returned Sunday night, I'd received a bunch of frames from WA4SIR ack'ing a number of ground stations. The station was a TR-2600A with a 1/4 wave ground plane up about 8 feet (temporary setup).

My brother sez he monitored WA4SIR talking voice with his Realistic scanner, nothing but a whip antenna on that.

Last night, at 9:50PM locally, I was standing in my back yard in Lancaster (maybe 15-20 miles from Edwards) and was treated to the LOUDEST set of sonic booms I've ever heard (and, living near Edwards, we get house-shaking booms almost everyday). These were louder than the SR-71 when it passed over LA earlier this year, and these were louder than I've ever heard the shuttle before. The glass in my sliding glass door flexed in and out. I could hear a thundering, rushing noise for sometime afterwards, also, I suspect the windnoise from the shuttle.

I love living near Edwards.

Dana

A number of people have described the old octal-plugin crystam oven. Be aware that these ovens are of primary benefit over WIDE ambient temperature conditions.

The temperature in the oven generally cycles about 1 degree C on a one-minute period. Not exactly the thing for many applications. A proportional oven, with thermistor and analog drive to a heater resistor, and a substantial thermal mass for low-pass thermal filtering. One sometime-overlooked problem is that the heater resistor should be wound "non-inductively" to avoid having it create a substantial magnetic field which can affect crystal frequency slightly (for the purists).

Crystals designed for "room temperature" have a somewhat different freq vs temp curve that "oven" crystals. Oven crystals have a single "turnover" point in the curve, at the temperature of the oven, so the freq vs temp derivative is zero there. Room-temperature crystals have two turnover temps, near the low and high temp ends of the ambient range; they are of opposite sign. The intent is to get the slope between these points as near zero as practical, but it isn't quite perfect. Either design should be suitable for most ham purposes, when in an oven. The hint is that upper zero-derivative point on a room-temp crystal is quite hot, the lower is below room temp.

One problem with the ham community today is that people who do not like CW have already been filtered out.

Imagine what the ham community would be like if you had to operate SSTV in order to be a ham. SSTV would be more popular than it deserved to be, and it would tend to become a sacred cow.

So also Morse Code.

You forgot rec.radio.noncomm.amateur.ham.misc.john-stanley.personal.hierarchy.

Is this very reasonable suggestion a personal affront to you or something?

I was going to refrain from voting at all, but now I think I'll vote just
to piss you off.

Photo Radar is NOT in the K or X band, but in hte Ka band, where these
restrictions do not apply. I'm not sure if they never applied there, or

if there was a special exemption for these types of equipment.

HOWEVER, I would appeal photo radar on totally different grounds. How can you confront your accuser in court when there was absolutely NO HUMAN INTERACTION at all? Totally unconstitutional, IMHO.

Re: Rigs

I'd recommend a pass thru someone's back issues of QST magazine for product reviews. Some of the glitches they find might be serious.

Also of note, one of the Ten-Tec high-end rigs is a ham-only rig in order to eliminate synthesizer phase noise. (I forget the rig name.)

Don't let your head be turned by all the "stuff" on the high-end rigs. Most of it is for fairly specialized situations such as contesting.

I have yet to figure out what "professional grade" means when applied to "amateur" radio equipment.......

I concur, though I've a few friends who refer to it as "Horrible & Hill",
as they think that, while it's a great book if you already have an idea of
what H&H are trying to convey, it's too terse to be a true beginners book.

Browse through a copy and decide for yourself.

This would have been true 25 years ago when I took my General, but it has not been the case for some time now. The Technician and General class written exams are no longer the same.

Someone was asking about this; the diagram attached should explain the usuall commercial antenna installation practice.

```
 !       !       !       !!      !
 !       !       !       !!      !
 !       !       !       !!      !     RIGHT!   Mast extends through the
=========================++========    field of the antenna and so the
 !       !       !       !!      !     symmetry is preserved.
 !       !       !       !!      !
 !       !       !       !!      !
                         !!
                         !!
                         !!
                        ----
                        !  !
                        !  !
```

```
                                       !       !        !            !
          WRONG;     Stub-mast is      !       !        !            !
          not mounted symmetrically    !       !        !            !
          with respect to the field   =========================++======
          of the antenna and will      !       !        !      !!    !
          distort the polar diagram.   !       !        !      !!    !
                                       !       !        !      !!    !
                                                               !!
                                                               !!
                                                               !!
```

Of course, if you can get a non-metallic stub-mast, so much the better.
Fibreglass windsurfer masts can be used here; the slight flexibility
may make the difference between your antenna surviving high winds, and
finding a tangled heap of tubing in the back yard one morning....

Due to the large number of USENET sites and potential voters
at Universities and other places with long holiday breaks, you might
want to consider delaying the vote slightly to ensure that all
interested parties have an opportunity to vote. If the vote doesn't
start until it is posted in news.announce.newgroups, it might be
actually be held 6 January through 27 January, which should be enough
delay for almost everyone concerned.

Also, don't forget:

The Student Manual for "The Art of Electronics"
by Thomas C. Hayes & Paul Horowitz ---

It's a spiral-bound workbook (for lab) that contains many
"hands-on" tests to illustrate the text of the "main" book.

All (most) of the diagrams and figures are hand-drawn -- makes it
look more "friendly" and more like a lab book.

Also a great book!

Monte

I operated at W3USS this past weekend in the 10 meter contest. It was only myself and K3ZJ, and I only was there Saturday afternoon and early evening, but we had a blast. Ended up with about 2250 QSOs, about 1700 or so on SSB since Dave is not a CW op. Not sure of the multipliers yet, since Dave was using the CT logging program, rather than the NA program which is much better for the 10 meter contest.

W3USS is the club station of the Capitol Hill Amateur Radio Society, and is maintained thru the sweat and efforts of current and past Senate employees. It was in its hay-day (sp?) when Barry Goldwater was still around, in fact he had a rig in his office and a switch where he could preempt the antennas from the club station in the basement. The setup was K3ZJ's FT-1000 (great radio), Dentron amp, and a TH6 on a 40 foot tower on the roof of the Senate office building, which means the antenna is at about 150'. The roof is copper plated but the tribander still seems to play real well. An old IBM 3270-like, XT predecessor was used as the logging computer, which is strange because it has a totally non-standard keyboard. Anyone I worked on CW, I apologize if I sent QRL QSY instead of TU!

W3USS is located in the District of Columbia, which counts as a seperate multiplier in the ARRL DX and 10M contests. Any of you who worked it and would like a QSL, QSL via W4WG. USS returns QSLs 100%.

Band conditions were good here, not sizzling like a few years ago, but we had an average rate of over 85/hour we were on. Nice DX: JD1, NH2, AH3, VR6. JA activity seemed down from previous years, mayber they are all working weekends getting HDTV to market.

In article <oHqVT4w163w@phoenix.com> stanley@phoenix.com (John Stanley) writes:
>
>   What is the real progress? Changing the name from rec.ham-radio to
>rec.radio.amateur is not progress of any kind, much less "real". It is
>just "change".
>

John, I have to ask how can a logical person say that a name change to better describe this group to tens of thousands of sites worldwide is not progress?

Merriam-Webster defines real as: Authentic, genuine, actual and true.
Progress is defined as: To develop a higher, better or more advanced stage.
How can you state that it is not progress of ANY kind? Are your criteria different than that of the international dictionary? If so, why?

>   Since there was an affirmative reply to the post of one site against
>it, then there are obviously TWO sites. If there are TWO, then there are
>probably more.
>

Maybe not, and if so, so what? The majority consensus will prevail as defined in the net rules established for creation of new groups. Two sites MAY be 2 no votes if they even take the time to vote.

>   In fact, EVERY site will have to go through the trouble of changing
>the newsgroup names, feed and fed information, etc. All for what? A
>simple name change? Will this happen without incident? Ha ha ha.
>

What trouble?
Since you obviously are not up to speed on group creation, removal etc, a short education is in order for you. Many sites have AUTOMATIC new group creation enabled. Those that do not, require a simple intervention by the news administrator. I am the news administrator at this site, so don't try to snow me with how difficult this all is!

>   The only real change is the addition of a .rules or .legal subgroup,
>which could be done WITHOUT any other name change.
>

Wrong. See defininition of "real" above.
Sure it COULD be done without any other changes.
If you are not going to change something with the goal to make it as near perfect as something man-made can be, why bother at all?
Do you approach all your projects with an attitude of why bother to do my best?

>   Your post is yet another wild claim of perceived benefit with no
>justification provided, and it the only utter nonsense here. I have asked
>several times for a real justification for this change, and NOBODY has

>answered. The only "reason" so far is "it's a new name". So what?
>

The JUSTIFICATION was stated at the beginning of the reply as well as by numerous other posts on this subject. The only wild claims were made in your emotional original post and reply.

>   Will it stop the cross posts? Hardly. Does it describe anything
>better? No. Will it change ANYTHING, other than the name? Ha ha ha. No.
>

I've seen some negative posts in the last 4 years in this group.
You should be proud to be right up there with the worst of them, providing NO rational basis for your claims. You are guilty of the very same error you accuse me and others of making.

>   Your claim that a name change is real progress is the same as claiming
>that all New York City needs to do to solve it's problems is rename
>itself to South Bend, Indiana.
>

This is an extremely inaccurate analogy. I never claimed that the name change would provide a solution to this groups problems. Maybe next time you should spend as much time reading as you do wasting bandwith with inaccurate analogys, erroneous and inflamatory claims.

SAREX MISSION IN REVIEW

HR AMSAT NEWS SERVICE BULLETIN 342.01 FROM AMSAT HQ
SILVER SPRING, MD DECEMBER 8, 1990
TO ALL RADIO AMATEURS BT

SAREX Operations Generally Successful

Starting off with a smooth launch and a "nominal trajectory," STS-35 lifted off in a spectacular night time launch with two gigantic white pillars of fire trailing behind. Aboard the shuttle Columbia was Ron Parise (WA4SIR) and the Shuttle Amateur Radio Experiment (SAREX). The SAREX consists, on this mission, of a packet radio ROBOT TNC-2 and a 5 watt FM transceiver. Operating only during his work shift, over a 1000 contacts have been logged. During his "spare" time, Ron answers questions posed by inquisitive school children. Thanks to the efforts of relay stations in Australia (VK5AGR, VK2AS, and VK6IU) and in Brazil (PY2BYO), school children from over forty schools got to hear Ron tackle some very difficult questions about space science and spaceflight. Rich Ensign (N8IWJ), an astronomy and science teacher in the Detroit area who has been monitoring these sessions is quite impressed with the questions that have been asked of Ron.

Reports from all over the world have been pouring in about the successful "connects" packet stations have made with WA4SIR. One factor which made communicating to WA4SIR difficult, if not impossible, has been Columbia's attitude. Because the ASTRO-1 experiments have required shuttle attitude adjustments, the window-mounted antenna on the pilot's side, i.e., on the right side above the centerline, has not always been earth-pointing. N3FKV notes that when the antenna is pointed away from Earth, as it has been on several occasions, signals have completely disappeared. However despite this problem, when all the QSO's are counted, it will be seen that the SAREX packet ROBOT station was a major success.

One of the final milestones yet to be achieved is a QSO between U2MIR and

WA4SIR before Columbia returns on December 10. There was a very close approach between Mir and Columbia this week, so close in fact that they were only a few dozen miles apart. In what was a coincidence, Musa Manarov (U2MIR), the most active of the amateur radio operators ever to have flown aboard MIR, has been returned to the space station this week. It is hoped that toward the end of the mission of STS-35 the the first QSO ever between "space mobiles" will take place.

For those who have made a packet contact with WA4SIR and would like to receive a QSL card, please send your QSL card, QSO number, and an S.A.S.E. to ARRL Headquarters.

MICROSAT UPDATE

HR AMSAT NEWS SERVICE BULLETIN 342.02 FROM AMSAT HQ
SILVER SPRING, MD DECEMBER 8, 1990
TO ALL RADIO AMATEURS BT

The AMSAT Engineering Team has issued a Microsat status dated 5 DEC 90:

AO-16 is in the ROM safe mode expect for PHT telemetry which was activated by 6 DEC 90 5:00 UTC.

AMSAT's worldwide network of microsat command stations detected a change in the average battery voltage on the early evening US east coast passes on 4 DEC 90. The battery voltage was very low at the end of dark pass, 9.7v instead of the nominal 10.4v (battery voltage is one of the most important parameters to monitor, which explains why so much interest is placed on its well being). Command stations Bruce Rahn, WB9ANQ and Jim White, WD0E, noticed things were not as they should be, did some initial analysis, and bumped the problem up to N4HY and NK6K.

WD0E changed the power management limits on the mid US pass in hopes that this would stabilize the system. It was decided that if the average voltage continued to decline, AO-16 would be manually placed into the ROM safe mode, which would recharge the batteries. On the west coast pass, the battery voltage had climbed back to 10v. AO-16 was left running, in the hope of gathering data from stations on the day side of the orbits.

Alberto (I2KBD) and Carlo (IW2CTJ) did acquire daytime telemetry on following passes, N4HY determined that AO-16 was charging at an erroneously small rate. By the next US east coast pass, the onboard software had gone to its low voltage protection mode, which uses a transmitter setting of a few 10s of milliwatts. After gathering additional diagnostic information to verify that it was a software rather than hardware problem, N4HY forced AO-16 into the ROM safe mode. This mode does not use dynamic power settings, and will recharge the batteries. The problem is believed to be software only, and is likely to be related to a recent software change to increase efficiency of the BCR during dark passes.

Interestingly enough, spacecraft hardware engineers had requested that the operations group do a 50% discharge on the batteries soon, to gather data and to erase Ni-Cd "memory". As this has now been done, albeit under somewhat less controlled circumstances than planned, that procedure will no longer be necessary.

This problem is unrelated to problems with commissioning of the file server; work in that area continues. The latest version of the file server is up and running on UO-14.

[ANS thanks Harold Price, NK6K for the information for this bulletin]

SB ALL @ AMSAT $ANS-342.03
U2MIR RETURNS TO THE AIR/SPACE

HR AMSAT NEWS SERVICE BULLETIN 342.03 FROM AMSAT HQ
SILVER SPRING, MD DECEMBER 8, 1990
TO ALL RADIO AMATEURS BT

Amateur Operations aboard MIR re-commences

Within two days of returning to the Soviet Spacestation MIR, Musa (U2MIR) has resumed amateur radio operations. WA1OMM reports that he had a short QSO with Musa on 145.55 FM on 06 Dec 90. If you will recall, Musa was very active during his first assignment aboard MIR. It is unclear as to how long Musa will be assigned to MIR on this go-around (pun intended). MIR's 51 degree inclination orbit makes it accessible for just about all of the amateur population (Columbia's 28.5 degree orbit makes it very difficult for stations much above 40 degrees in latitude to get a good shot at the orbiter).

Although Musa's arrival on MIR was too late to attempt a contact with WA4SIR onboard Columbia, there may be an opportunity toward the end of Columbia's mission when the two spacecraft will be within a few hundred kilometers of each other. (Approximately every 7 to 8 days the orbits of the two spacecraft 'allign' allowing visual and direct radio contact.) If that occurs, Ron and Musa will attempt the first ever US to Soviet orbiter communication. This QSO will also be note-worthy in that the commander of the Columbia Astro-1 mission is Vance Brand, who participated in the Apollo-Soyuz Mission in 1975 and it is expected that Vance will have a few words to share with the Soviet Cosmonauts.

In January, MIR is scheduled to receive a packet radio experiment package which is to be permanently installed on MIR. It will use a standard TNC employing AFSK (FM) modulation of AX.25. Besides operating in packet mode, it will also have a voice synthesizer which will transmit greetings and general information in English, Russian, and German. The 'Club' Station on MIR has a dedicated exterior antenna and it is expected that the permanent station setup will make it convenient for the other cosmonauts to occasionally pick up the mike and make a few QSOs. If you missed having a QSO with WA4SIR, try listening for Musa and the gang on 145.55 (simplex).

ZRO TEST SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 342.04 FROM AMSAT HQ
SILVER SPRING, MD DECEMBER 8, 1990
TO ALL RADIO AMATEURS BT

Schedule of ZRO Tests, Fall Edition

The following schedule of Mode "B" and "JL" ZRO tests were chosen for convenient operating times and favorable squint angles. The "B" tests can be heard on 145.840 MHz and the "JL" test on 435.945 MHz.:

Saturday December 15, 1990 at 1630 UTC "B"
Saturday December 22, 1990 at 0530 UTC "B"
Saturday December 22, 1990 at 0645 UTC "JL"

Note that the dates and times are noted in "UTC." The tests on December 22nd occur late Friday night for those in North America. Any changes will be announced as soon as possible via the AMSAT HF and AO-13 Operations Nets as well as ANS. Recently updated ZRO brochures are available from WA5ZIB, Andy MacAllister, AMSAT V.P. User Operations, 14714 Knightsway Drive, Houston, TX 77083 for an S.A.S.E. with two units of postage. The brochure describes test procedures and means for obtaining certificates and gives some historical background about the program.

All listener reports with date of test and numbers copied should be sent to WA5ZIB at the address above. A report will be returned verifying the level of accurate reception. Good luck!

/EX

SB ALL @ AMSAT $ANS-342.05
OPERATIONS NET SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 342.05 FROM AMSAT HQ
SILVER SPRING, MD December 8, 1990
TO ALL RADIO AMATEURS BT

AMSAT-NA Operations Net Schedule Announced

AMSAT Operations Nets are planned for the following times.
Mode B nets are conducted on an AO-13 downlink frequency of 145.950.
Mode J/L nets are conducted on an AO-13 downlink frequency of 435.970.

Date	Phs	mode	UTC	NCS	Alt.	U.S. day
15 Dec 90	97	J/L	1400	N5BF	WD0E	Saturday

A new schedule covering the period after 26 December 90 will be issued shortly.

Nets are scheduled for North American geographic coverage and time zones although other parts of the world are often within the footprint and check-ins

```
from everywhere are welcome.  Those who don't have adequate and convenient
coverage from this net are encouraged to schedule their own nets via AO-13.
Write to AMSAT Headquarters or send a note to N5BF @ WB6YMH with your schedule
to have it included in ANS.

For information on the amateur satellite program and how you can participate,
contact AMSAT-NA Headquarters at P.O. Box 27, Washington, DC 20044, phone
(301) 589-6062, or contact your local AMSAT Area Coordinator.

SB ALL @ AMSAT      $ANS-342.06
FALL AO-13 TRANSPONDER SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 342.06 FROM AMSAT HQ
SILVER SPRING, MD DECEMBER 8, 1990
TO ALL RADIO AMATEURS BT

The transponder schedule for AO-13 is as follows:

              Mode-B :       MA 000 to MA 095
              Mode-JL:       MA 095 to MA 125
              Mode-LS:       MA 125 to MA 130
              Mode-S :       MA 130 to MA 135
              Mode-BS:       MA 135 to MA 140 <---  QRP on Mode B Please
              Mode-B :       MA 140 to MA 256
              Omnis  :       MA 220 to MA 040

This schedule is expected to continue through 26 Dec 90.

The command team requests that you make a specific effort to use QRP on Mode B
between MA 135 to 140.  This is specifically to help those people
experimenting with Mode S. (Although you really should always keep checking
that your peak signal is never stronger than the beacon (145.813/435.651 MHz)

The spacecraft attitude of AO-13 is calculated to be:

                     BLON = 179.7  and  BLAT = -3.3  for 17 December 90

AMSAT-OSCAR-10 appears to be receiving sufficient solar panel illumination to
support Mode-B transponder operations. The transponder may be used, carefully,
at all points of the orbit except MA 254 - 006 when eclipses occur.  If beacon
or transponder signals show signs of FMing, users should cease all transponder
use immediately.  An APPROXIMATION of the spacecraft attitude for AO-10 is :

                 BLON = 4.0    and  BLAT = 0.0  for 15 December 90

/EX

KB2JAC/9 wonders what happened to ham radio in W.W. II. For an extremely brief summary, I suggest the December 1990 QST, wherein there is a short accounting as part of the review of the last 75 years of ARRL.

All US hams were ordered off (by the FCC) on December 8, 1941. There were all sorts of worries about spies. Hams, in general, were not presumed to be any less likely to be sending "secret" messages - thus off the air to reduce the work of the monitoring folks. Many hams ended up in the service, and most work weeks in factories were 6 full days. This didn't leave a lot of free time. There was a War Emergency Radio Service (WERS) in association with Civil Defense, which attracted quite a few hams. It was on the old 2-1/2 meter band 112-116 MHz, using AM (sometimes modulated oscillators) and superregenerative receivers. Awful performance. I was a bit young for such things, and didn't know any active people in Richmond, VA., where my family was moved with the US Patent Office "for the duration". The Patent Office was sent out of Washington to make room for more immediate war agencies.

The Washington Radio Club continued to meet throughout the war, kept alive by among others, its YL members such as W3CDQ and Fran Darne (call forgotten). Amateur OPERATOR licenses continued to be issued, and some of my now-friends (ie: W3XO) got tickets during the war.

73, W3OTC

A little while ago, Ron Todd posted information on how to get a subscription to Communications Quarterly (cute pun, eh?). Well, too late for me, but they also have a toll free number

(800) 457-7373.

I subscribed blindly (not regreting it at all, after reading the first issue), but for the curious, the first year's subscription is $27.95. The price per issue is listed as $9.95 on the cover, but I have not yet seen it surface on newstands that hawk CQ and 73.

A little pricy, but IMHO (except for a minor nit), it is a *much* better bang-for-the-buck than either CQ or 73. There is not a single mention of a contest! I would have paid an extra buck for that :-).

In the first issue, there is everything for a LowFER nut to people addicted to the HBR-xx articles that used to appear in the QSTs of the good old days. Not surprisingly, the whole thing has a Ham Radio (the publication) "feel" to it.

I am a little disappointed at the number of errors when equations came into play, though. Slightly weak technical editing, perhaps? Not just in one article but everywhere an equation appears, almost. E.g., note the variable of integration in the first equation of the DSP article; similarly, the summation index of the inverse Fast Hartley transform in the same article. Notice that the Hanning window in that article evaluated to be a constant! :-) Tsk, tsk. Bad sign for an article that is a tutorial. The article on S-parameters carried similar sloppiness - h22 in Figure 2 should not be dimensionless and they invented a new symbol that I have never before encountered for the dimensionless h12 :-).

But, anyway, perhaps nobody depends on equations published in Ham publications, so who cares, eh?

Still, if the future articles maintain the interesting technical mix that appears in the first issue, they can be assured that I will continue to subscribe. I only wished that I didn't have to wait three months for the next issue! When was the last time you said that after reading CQ or 73 (sorry, W2NSD :-)?

So, for those of you who are sitting on the fence: go for it! If anything, it will show them publishers that there are still Hams interested in the technical aspects of the hobby.

73 and keep building 'em thar gear,

>15 for more info. Radar guns are part 15 devices, from what I remember.

I don't recall a prohibition against receiving radar in the ECPA. Does that mean there is explicit Federal permission? If so, aren't state laws making radar detectors illegal preempted by ECPA? And what about out-of-state vehicles? If radar detectors are legal in the state your car is registered in, isn't it impermissible interference with interstate commerce to bust someone for driving through another state with one?

Too bad no one has the time or money to persue this and maybe kill such laws once and for all.

Gawd -- don't you hate rumors! How about this one we picked up overnight in Chicago.

On December 13, the FCC will make its long awaited Communicator Class announcement. But the shocker will what else they announce on that date: that element 1B will no longer be required for General and Advanced and that element 1C will no longer be required for Extra. Yes, the hot rumor is that the 13 wpm and 20 wpm requirements are dead and that one will only need to demonstrate code proficiency at 5 wpm for *ANY* amateur license (excluding, of course,the Communicator License which will be code free.)

The FCC can do this, because, as I pointed out in the following
post I made here on November 6, while code proficiency *is*
required by international agreement for HF work, speed above 5 wpm
is *not required.*

(Now, just wait until Thursday, and watch the FCC blow this rumor
away.)

On November 6 I posted:

:>In article <7880341@hpfcdc.HP.COM>
    ajs@hpfcdc.HP.COM (Alan Silverstein) writes:
:>
:>So it seems clear to me that it's an improper REQUIREMENT. Regardless
:>of how easy it is to learn, regardless of how nice or fun or efficient
:>it is, if it's not something you must know to be a successful ham and
:>to contribute to the hobby, it's an improper requirement.
:>
:
:Alan, the unfortunate thing is that it is required by international
:agreement for work on the HF bands. However, what is NOT required by
:that agreement is speed above 5 wpm. Since we HAVE to have code for
:HF, we should test ONLY at 5 wpm. If people think it would be nice to
:show greater proficiency than 5 wpm, let's roll that into the written
:exam process by adding questions to the written. I.e., let's add 5
:code questions to the extra, increasing the questions asked to 55 and
:the passing score to 41. That way, if you fail the five code
:questions, you don't fail the test.

That's an argument against ANY change, not just the name change and group addition. And it's also largely a problem with ALTnet and ALTnet only. Assuming that the people who are working on the mkgroup authentication hack finish fairly soon, this will be a moot point, in any event.

>   Hmmm. News.*, comp.*, rec.*, talk.*, sci.*. Rec.ham-radio seems to fit
>quite well in the rec.* hierarchy.

Yeah, the same what alt.swedish-chef.bork.bork.bork does.

This does not justify having ham-radio as a second level domain, which is the principal contention.

>   Moving rec.ham-radio down under rec.radio will do nothing to reduce
>the growth.

Never claimed it would. It does however make that growth easier to manage.

> It will do nothing to sort out the traffic into more
>appropriate places. Creating .legal (or .rules) will help, but could be
>done much more easily as a subgroup of rec.ham-radio. Imagine, any site
>not wanting rec.ham-radio.legal need do NOTHING, versus creating a new
>set of groups and deleting old.

Contradiction #1. You claimed earlier that it was a royal pain to hack the distribution. Now you claim that they "need do NOTHING". Uh huh.

>   There is no good justification for third level status, either. Is
>being at the second level really a status symbol? If so, then we should
>be the LAST ones to suggest a change.

No, there's not status associated with domain level. The justification for hanging the ham-radio tree under the radio tree is both intuitive and obvious. In fact, hyphenated domain levels are seen as being somewhat archaic...

>   What will moving down a level do to traffic? It will increase it. It
>seems, from my experience, that feeds often do the easiest thing for
>them. If you ask to have rec.arts.startrek added to your feed, they will
>probably add r.a.*.

This is only a problem if you assume that the readers of rec.ham-radio are not interested in the rest of the rec.radio hierarchy, an assumtion that is false for the most part. Now whether they have the time to read the entire hierarchy is a different matter...

>Now you have all of arts being stuffed down your
>throat, using your bandwidth, filling your junk. (Junk is the highest

>volume group, here.) So, moving under rec.radio means you will get all of
>rec.radio, like it or not. A waste.

The usual cause of "junk" filling up is a mismatch between your distribution and you active files. Bnews (and presumably Cnews) junk articles that they can't find an active entry for. If your "junk" is in fact your highest volume newsgroup, then it sounds like your site is misconfigured. Remember, just because "you" don't subscribe to a group doesn't mean the system won't keep the group around for others to read.

> Which rec.radio is related to packet? Maybe the best thing to do is
>just be subsumed under rec.radio.noncomm. Not rec.radio.noncomm.amateur,
>just r.r.n. There is pitifully little traffic in r.r.n now, so we would be
>able to take them over with little effort.

The purpose of the hierarchal structure of USENET is to divide posts into meaningful structure. What goes on in r.r.n has little to do with Amateur Radio (read the group charter). Moreover, your suggestion of "taking it over" is childish at best.

> If it made any sense to change, then yes. Since there is NO benefit to
>changing, then there is no sense to change. I haven't seen the arbitrons,
>but my impression is that rec.radio.noncomm is nearly dead, and
>rec.radio.shortwave is mostly crossposts from r.h. Which tree is smaller?

It's quite clear that noncomm has little if anything to do with ham radio. It is quite clear that ham radio has something to do with radio. At least the last time I took E&M it did, anyway.

> Where in the suggested change was the .d group? Aren't discussions
>still going to take place in rec.radio.amateur?

Jay and I hashed this out about a week or two ago. Basically, .legal IS meant to be the debate (old term for .d groups) group for the r.r.ham (at this point most likely ham => amateur).

> I agree with the suggestion to add rec.ham-radio.legal. It can be
>quite simple to do that.

There is no difference in difficulty between adding rec.ham-radio.legal only and adding and deleting four newsgroups. You still have to enter emacs only once, if at all.

On the whole, the name change is more of an administrative change than anything else. If nothing else, it allows for a more logical growth in the tree structure for future splinter groups off of the ham radio discussion section. Certainly, the name change does't address some of the other problems (for example, traffic volume) that currently exist. But it does make addressing those problems easier, and at a very minimal cost.

I dont know about who has reviewed it but I can give it my personal recommendation as one of my favourites. Can you get to meet one at a local library? It is possible that a university library could give you the opportunity to sit down with a copy for a few hours and form your own opinion. The other books I'd recommend personally are:

Frequency synthesisers   ..... Ulrich Rohde

The Art of Electronics 2nd edition   Horowitz&hill

Single sideband circuits & systems (I think is the title)
A boot by Collins staffers including Sabine and Schoenike
as an update of the old pappenfuss/shoenike book

should see tou through a good few sleepless nights !

Here are a couple more somewhat useful modifications to the Kenwood TH-75 dual band HT, in addition the the previously posted mods for talking to the Police and Sheriff.

I. Kenwood somehow got the idea that their HTs don't require a hole in the case of the radio for the microphone. On their earlier HTs, and on the 75, the microphone is conductively coupled to the case of the radio, rather than having some hole for the audio to pass through like other manufacturers have. For higher fidelity audio and that comfortable living-room stereo sound, I highly recommend drilling a hole in the case of the Kenwood. (Remove mic element first...) A couple of holes can be discretely drilled near the speaker grille just above the last "4" of the "144/" marking on the front. For fuller audio, drill a bigger hole. You should also place a small piece of cloth between the mic element and the case when you put everything back together to cut down on wind noise.

II. I was disappointed Kenwood didn't have a trickle charge feature for the battery pack when you plug the radio into an external DC source. This is easily modified, and the result works well keeping a 50ma. charging current to the battery.

Remove the front panel of the radio and the top knobs. CAREFULLY unsnap the top plastic cover with the volume markings, etc. Remove the five screws holding the TX-RX board to the back panel. (You must remove the TSU-6 to get to the 5th screw.) Lay this board on the bench so the foil side is facing you. The external DC-in jack has three solder leads arranged vertically holding it to the board. Jumper the upper two leads toward the top of the radio. This insures a negative lead connection to the battery pack with 12V plugged in. Next, solder a 100 Ohm resistor across the large diode labeled D2 at the bottom of the board. This provides the 50ma. (approx.) charging current to the battery. Reassemble the radio.

- These are a couple handy mods and will insure that when you call your emergency in to a police dispatcher, your audio will be clear and your battery charged. But, don't forget and leave the 12V plugged into the radio for a couple days and fry your battery pack. The things are damned expensive, and I take no responsibility for the use/abuse of the above mentioned modifications.

I don't get it! Do you mean he sits by the side of the road, waiting for someone to come by with a radar detector, and then just guesses the speed without turning the gun on?

Or do you mean he paces the car by following it? In this case, he would never use radar anyway.

Please clarify.

I like it! I don't _believe_ it but it strikes me as a long-overdue
modernization.

People talk about how a "no-code" license will lead to a "no-theory"
license. It seems to me that the opposite is the case. The "code
forever" people (especially ARRL) are adamantly telling us that we
must _keep_ the Novice class _because_ its theory requirements are
minimal! Never mind TCP/IP, folks, Morse is the wave of the future! -)

Jim, I think you lost the thread here. We were talking about unmanned radar units being put along highways for the sole purpose of tripping detectors. You're right in saying that a officer who is making a stop, or just driving around and ignoring the radar gun probably won't get cited for having an uncontrolled transmitter operating. I was talking about roadside radar guns that are left on continously for the sole purpose of tripping detectors.

I propose formally that Jay's proposal be expanded and revised as follows. Discussion should occur in news.groups per the USENET Guidelines.   If Jay is willing to collect votes on this sort of proposal, I'd suggest he be the one to make the formal CfV and such at the appropriate time.

PROPOSAL:

There should be three votes run in parallel (that is, use one ballot and CfV):

1) Move the existing Amateur Radio heirarchy (keeping all existing groups)
   FROM   rec.ham-radio.*   TO rec.radio.amateur.*

2) Make the existing parent group (rec.ham-radio/rec.radio.amateur) into
   an equal level group with the rest (rec.ham-radio.misc/
   rec.radio.amateur.misc)

3) Create a new group for legal/rules discussions (rec.ham-radio.legal/
   rec.radio.amateur.legal)

RATIONALE:

The heirarchy shift would make the whole USENET namespace more consistent (see rec.radio.shortwave and rec.radio.noncomm) and makes the Amateur Radio groups easier to find for those non-Americans who aren't up on US-specific radio jargon and would find the Amateur Radio groups more easily.

The moving of the "parent" group should help reduce cross-posting (this has been seen widely across the net) and also makes the namespace more consistent.

The creation of a legal group would split existing traffic in a clear manner and make it easier for all readers of the Amateur Radio groups.

Discussion should take place in news.groups per the USENET Guidelines.

(Various descriptions of ham purgatory were deleted)

There was a fiction article in one of the ham magazines in the 1960s
where the deceased ham finds himself in what must be a ham paradise
in the hereafter. He is shown a HUGE station, with every kind of exotic
antenna available...all the latest gear, big amplifiers, etc.

But when he gets on the air and calls CQ, no one comes back...and he
can't hear anyone either.

When he complains to his hosts, they say: "Just where did you think you
were? This is hell."

--- SOLAR TERRESTRIAL FORECAST AND REVIEW ---
December 09 to December 18, 1990

Report Based In-Part from Data Obtained from the
Space Environment Services Center
Boulder Colorado

SOLAR TERRESTRIAL REVIEW FOR 02 DECEMBER TO 08 DECEMBER.

Solar activity this week again ranged from low to high. The most significant event was the major class M6.6/1F flare of 04 December which originated from Region 6397. This region was unusually active early in the week. It unexpectedly produced this major flare when magnetic gradients within the region were observed as being relatively weak. It was also responsible for several M-class events and numerous C-class flares. The major flare of 04 December occurred at 02:03 UT and lasted a respectable 39 minutes. It had no terrestrial impacts, due to its distant location (N08E56), lack of emissions and absence of sweep frequency events.

The solar flux continued a steady climb this week with the return of numerous regions. At the present time (09 December), there are 15 active regions on the sun, four of which are showing signs of increased spot growth and flaring.

Region 6397, which produced the major flare earlier in the week, stabilized during the week and is now beginning to show increased signs of instability. At 09:28 UT on 09 December, this region produced a class M1.0/1F impulsive flare at a location of N09W11. This region is also exhibiting signs of increased magnetic complexity, although it is still rated as a bipolar beta-type spot group.

Aside from Region 6397, the only other region to produce any significant minor flaring was Region 6410, which spawned a class M2.8/1N flare at 08:21 UT. This flare borders as a long-duration event, maintaining energy output for 65 minutes. However, it's location (N02E79) will prevent it from having any geophysical impacts on the earth. This flare is suspected of producing a moderate-duration, moderate-intensity SID/SWF. However, this has not yet been confirmed.

The background X-ray flux, which is (among other things) an indicator of the intensity of solar activity, has increased over the week with the appearance of the numerous new solar regions. It is currently holding at an X-ray level of C1.5.

Geomagnetic and auroral activity this week was notably low. The only exception to this was on 04 December when geomagnetic activity increased to unsettled levels over most latitudes. High latitudes experienced a few brief periods of minor storming. But other than that, activity remained relatively low. Auroral activity was visible over high latitudes and northerly middle latitudes on the evening of 04 December, but returned to generally non-visible levels for the remainder of the week.

HF radio propagation conditions were normal to above normal this week, due in part to increased ionospheric ionization and low geomagnetic activity. MUF's experienced a respectable increase over the last week and are now approaching (and exceeding over some paths) 50 MHz.

VHF propagation has been good this week, with increased prospects for DX on the lower-frequency VHF bands (ie. near 50 MHz). There have been no significant opportunities for auroral communications this week, however several SID's (particularly the one accompanying the major flare of 04 December) were capable of enhancing VHF propagation over the sunlit portions of the earth.

SHORT TERM SOLAR TERRESTRIAL FORECAST

Solar activity is expected to reach its peak during this week. The solar flux is expected to peak somewhere near 245-250. The sunspot number (currently 288) could break 300 before the week ends. Old Region 6368, which contained a complex beta-gamma-delta magnetic configuration, is due to return between 11 December and 12 December. This region was extensive in area, but exhibited signs of decay and stabilization before it passed out of view several weeks ago. Models currently suggest that this region has probably detensified and returned to a relatively stable, less extensive and less threatening configuration. Remnants of this region should rotate back into view between 11 and 12 December, which should produce a notable increase in the solar flux.

There is a slight possibility that old Region 6368 has maintained its extensive size and magnetic complexity. Should this be true, flare activity could increase further over the coming week. This is, however, going against what most of the models suggest.

Geomagnetic activity is expected to remain mostly quiet until later in the week, near 15 or 16 December, when activity is expected to increase to mostly unsettled levels. By near 19 December, activity should again return to quiet levels. Auroral activity should likewise increase near 16 December, peaking near 17 December. Periods of moderate activity are likely over high latitudes during this time. Middle latitudes will likely only witness periods of low activity on these dates, with a risk of sporadic moderate activity.

HF radio propagation conditions should be above normal this week, with significant possibilities for DX existing until near 15 December when decreased ionization and increased geomagnetic activity will hamper attempts at DX over many latitudes. There is a risk for brief flare-related short-wave-fades (SWF's) this week, due to the number of M-class flare-capable regions existing on the solar disk. The frequency of SWF's may increase if old Region 6368 returns with a complex configuration. Overall, this week looks like one of the better opportunities for HF DX.

VHF propagation conditions should be normal to above normal this week. The prospects for VHF DX are increased, particularly for those who work the lower VHF bands near 50 MHz. Daily MUF's are approaching 50 MHz at the present time and may be exceeding 50 MHz over some paths, providing potential openings on frequencies at and above 50 MHz. There is also a moderate possibility for flare-related VHF enhancements which might permit isolated periods of VHF DX.

SUMMARY OF ALL ACTIVE REGIONS VISIBLE ON THE SOLAR DISK AS OF 10 DECEMBER

Region #	Location	LO	Area	Class	LL	Spots	Magnetic Type

6385	S15W86	208	0090	HSX	01	001	ALPHA

```

NOTES:

This graph ONLY depicts geomagnetic conditions observed at Boulder, Colorado for the past 87 hours. Conditions to the north of Boulder will generally have slightly higher activity than Boulder, while conditions to the south of Boulder will likely have lower activity than those depicted here. However, the plots should present a good approximate average of planetary geomagnetic conditions.

For information regarding the interpretation and/or use of these charts, send a request for the document "Understanding Solar Terrestrial Reports" to: std_oler@hg.uleth.ca.

NOTES:

Predicted geomagnetic activity is based heavily on recurrent phenomena. Transient energetic solar events cannot be predicted reliably over periods in excess of several days. Hence, there may be some deviations from the predictions due to the unpredictable transient solar component.

               Cumulative 60 day Solar Activity Record
                   Start Date:  October 11, 1990
```

NOTES:

Left-hand column digits represent the 10.7 cm solar radio flux obtained from Ottawa. The right-hand column describes the relative solar activity for that period based on the average number of major and minor flares that can be expected for related solar flux values. Plot lines labeled with the letter "F" represent days where at least one major flare occurred (ie. class M5 or greater flare).

```

NOTES:

These VHF DX prediction charts are defined for the 50 MHz to 220 MHz bands. They are based primarily on phenomena which can affect VHF DX propagation globally. They should be used only as a guide to potential DX conditions on VHF bands. Latitudinal boundaries are the same as those for the HF predictions charts. For more information, request the document "Understanding Solar Terrestrial Reports" from: "std_oler@hg.uleth.ca".

The Larsen is a hipass/lopass design, with crossover near 300 MHz.
The implementation is very good, and would be hard to beat
without a lot of work. The reason I say this is that the loss
of the duplexer is so low that I could not reliably measure
it on the HP network analyzer I was using. I think that the
PL-259 connectors represent a larger loss than the duplexer
itself. You could home-brew an equivalent, or even improve
upon it (by using type N connectors), but for me, I have too
many other time demands and projects to try to beat Larsen
on this one.....de WD5IBS (Chris Kelly)

There's more to ham radio than just technical subjects. The object of adding
.legal and not .tech is to move the flames, not a subset of the non-flames. I
am strongly opposed to a .tech group, and don't see the overwhelming consensus
that one is needed that would change my mind.

Please continue this discussion in both news.groups and rec.ham-radio, as per
the guidelines...

 ->

        I have a simular problem here in Lima.  AEP, our local electrical
company, has been very poor in my opinion.  Here at my home, the voltage
```

rides from 117 to 127, which they say is in spec. At the TV station where I work, the power is as high as 132 volts at times.

A while back, the third leg would drop off occationally, dropping the transmitter. When the service man showed up he said that they were not having any problems, and we must have a "short" in the building. I told him that if 480 at 2,000 amps shorts, there is a hell fireball. The problem kept happening, and finally to prove my point I baught a bunch of Heathkit Mower Line monitors and set them on the line before and after the service entry. When it happened again, I had the account rep out and showed him the problem. He still claims that they did not have any problems in the system, but since that day our power has been solid.

My nickname for these folks are the "Joe Isuzu's Of Power Companies", because they remind me a lot of the guy who did the commercials, and plays on "Empty Nest". Too bad they just can't admit they made a misteak.

My advice to anyone looking for a simple, efficient, cheap, and almost foolproof allband antenna is the center-fed zepp, which has already been discussed recently in this notes group. Make it any convenient length (preferably at least 1/2 wave on the lowest frequency of interest) and feed it in the center with open wire. Use an L or T network with a balun to match it to 50 ohms. You can build this yourself using a roller inductor and one or two variable capacitors, or spend money on a commercially built tuner.

The commercial 450 ohm ladder line that is available for about $11 per 100' is adequate for just about all applications. It's also easy to make really superior open wire line using #12 wire and lexan or acrylic rod material for spacers.

THIS is the way to do it! Upload the program to one of the FTP or
E-MAIL reachable sites and then come on here and let the world know
about it. Try to pick a site that has real anonymus ftp or a site
reachable through a listserver, some of us donot have ftp.

Thanks,

Looks like somebody's wishful thinking again.  :-)  I'd be curious
to hear who started this rumor!

If I'm not mistaken, the FCC is required to publish a Notice of
Proposed Rulemaking, provide a comment period, a reply to comment
period, etc. before such an action can be taken.  The whole idea
of this procedure is so that they can't "pull a fast one"--just
like this one!

Lessee now... what other interesting rumors can we start...

Why are you worried about 20m anyway?  From what I've heard there, it's a
bunch of spoiled children.  The best behaved band right now is the 10M novice
section!

But there will be a bunch of bellyaching on 20m, you can bet!

Mike Yetsko

You point out that the term "radio ham" is understood by a growing majority of non-amateur's. However this doesn't indicate the connotations many non-operators associate with the term "radio ham".

In my experience, this term has no redeemable value with most "non-hams". In fact I would argue the connotations are so negative that we should do anything and everything we can to move to a more neutral term, and to dispell the negative connotations associated with Amateur Radio.

I think that the degree of "understanding" the average layman has of the term "radio ham" is the precise reason why we should adopt the term "amateur".

I suspect that at one time people would have argued the term "amateur" had negative connotations. I doubt many sane people would do so now.

=-=

While I'm here, I'd like to also state that I favor the following two names:

```
     rec.radio.amateur.digital   (to replace rec.ham-radio.packet)
     rec.radio.amateur.regs      (instead of r.r.a.legal)
```

Hello World

Here is again a great program, witch my friend Lars have made. You can get it by anonymous ftp from:

iesd.auc.dk (130.225.38.4)
username: ftp or anonymous
password: our username..

Filename: tsrem.exe and this text tsrem.txt
path   : /pub/ham-radio

Lars is soon going to make a new version of this program, so if you out there E-mail me inprovement I'am soure Lars will be happy.

God lock and a happy chrismas

Peter Sunesen

GREAT - LOOK HERE - Some news for TS440 owners.

>>> TSRem Copyright (c) 1990 by ARCOSOFT - Lars Rasmussen <<<

TSRem is shareware an may not be used to any commercial purposes.

TSRem is capable of remote controle your TS440 from the PC via one seriel port (COM1-4). Working all in text mode. No graphics.

On the normal program screen you have the following informations:

Contents of VFO A.
Contents of VFO B.
Contents of a group of 10 M. CH. with a comment to every M.CH.
All the informations in the TS440 display including RX and
TX frequency at the same time.
Mode of modulation.
Steprate 10 Hz - 1 MHz.

TSRem has 2 ways of operation:

1) Status display for TS440 settings. While you control TS440 in the normal way, by twisting knobs and so on, the PC displays updated info 1 sec. after you have pushed a button.

2) Remote control of TS440. Control the TS440 from the PC's keyboard. The force of the program.

Memory channels.

You can write a comment of 28 chr. to every memory channel.
Save memory contents to a disk file.
Load disk file into memory.
Print the memory file to the printer on LPT1.

It takes no more than 10 sec. to load or save a file, including reading or programming the memory in TS440. You can then have eg. a memory file for every operating mode, 100 memories for FAX or CW, or 100 memories for every band you will work on.

Furthermore:

Built in scanner. Scans the programmed M.CH. in 3 speeds.
Built in HELP menu.
It's possible to switch between COM1 to COM4 in TSRem.
Selectable IRQ for COM3 and COM4.

At the moment there is no English manual, but thats one of the first improvements to come.

If yoy find this program of any interrest, please send a donnation to:

OZ1HMN

No; it would not!
The rules changed a few years ago.
The current theory test for Technician is different from the test for General.
Upgrading to General would *still* require passing the *General* theory test!

> r.r.a.swap might be better as just rec.radio.swap, since this may encourage
> others with non-amateur-specific yet amateur-related equipment to post
> here as well.

I'm not as sure that much traffic of interest to amateurs would be generated. There's been about zero traffic in rec.radio.noncomm about equipment to sell/buy/trade. Of course, with a specific group for such... I don't think that this will bother any other rec.radio folks.   It won't bother me, at least.

(Declaration of ulterior motive: Many campus radio broadcast stations are hurting for lack of people with engineering skills. If the rec.ham-radio groups move into the rec.radio.* heirarchy, possibly more folks might cross over. Unlikely, at best, but it can't hurt to try...)

A similar argument could be made for rec.radio.rules as for rec.radio.swap, but I suspect that the regulations are sufficiently different that sharing the same newsgroup would only annoy everyone involved. Rec.radio.noncomm and the BITNET mailing list have had quite a lot of traffic on indecency/obscenity/safe-harbor, which I don't think would interest the hams.

After many months of effort to get the reciprocal ticket, I spent 2 weeks in FG at the end of November - a 50 MHz DXpedition. As far as I can tell, there had been no 50 MHz activity from Guadeloupe since I last operated in 1983.

When I arrived, I dicsovered that F6EPY had arrived a week before; now TWO 50 MHz stations in FG! The F2 conditions were not kind to either of us. We had no contacts into continental Europe, and very few into the US. Dominique (F6EPY) worked a handful of Ws the first time I went to the bank. He is a very avid operator (and works for a Motorola sub), and brought his laptop computer with the CT program, etc. He stayed with friends about 25 miles from me.

After F6EPY left, I worked three F2 stations, and MISSED the only good opening into the US. Gotta forget the beach and sightseeing!

```
Summary:  Continents: North and South America, Africa, Europe(CU)
          Countries:  FG, V2, J6, W, PY0, PY, CX, LU, CE, OA, ZP, CN,
                   CU, TR8, possibly 6W1
          By F2:   CN, CU, W
```

There was TE to South America nearly every evening for a number of hours. A new experience for me.

All-in-all, an unproductive DXpedition, but a good vacation.

73, Bob W3OTC   (ex- FG/W3OTC   very ex- FG0HZW)

Just try to explain the new portable PREFIX scheme to someone who is poor in your language , and you don't know his.   (No YLs heard, so no pronoun complaint.

I recently installed an AM filter (YK-88A) in my Kenwood TS-430S. After doing so, I find that the narrow position no loger works. It is my understanding that wide should be 6 kHz and narrow should be 2.4 kHz. I have heard that Kenwood has issued a service bulletin to correct this problem but I have not seen it. Can anyone provide the information necessary to fix this problem? Thanks.

ISBN 0-521-37095-7
1125 pages plus front-matter

This is somewhat like The Radio Amateur Handbook (ARRL), but in many ways is more up-to-date on basic circuit technology and topologies, has more "under your fingernails" theory, and has sections on BAD circuits as well as good ones!! And you'll be VERY surprised at how many of those you've seen published in various projects over the years.

This book is a rare jem indeed. Herewith is the table of contents to varying detail....

The Art of Electronics, Horowitz and Hill

- Chapter 1 FOUNDATIONS
  - Voltage Current and Resistance
  - Signals
  - Capacitors and AC Circuits
  - Inductors and Transformers
  - Impedance and Reactance
  - Diodes and Diode Circuits
  - Other Passive Components

- Chapter 2 TRANSISTORS
  - Some Basic Transistor Circuits
  - Ebers-Moll model applied to basic transistor circuits
  - Some amplifier building blocks
  - Some typical transistor circuits
  - Self-explanatory circuits
    - Good Circuits
    - BAD Circuits

- Chapter 3 FIELD EFFECT TRANSISTORS

- Chapter 4 FEEDBACK AND OPERATIONAL AMPLIFIERS

- Chapter 5 ACTIVE FILTERS AND OSCILLATORS

- Chapter 6 VOLTAGE REGULATORS AND POWER SUPPLIES

- Chapter 7 PRECISION CIRCUITS AND LOW-NOISE TECHNIQUES

- Chapter 8 DIGITAL ELECTRONICS

- Chapter 9 DIGITAL MEETS ANALOG

- Chapter 10 MICROCOMPUTERS

- Chapter 11 MICROPROCESSORS
  - A detailed look at the 68008
  - A compete design example: analog signal averager
  - Microprocesor support chipts

- Chapter 12 ELECTRONIC CONSTRUCTION TECHNIQUES

- Chapter 13 HIGH-FREQUENCY AND HIGH-SPEED TECHNIQUES

- Chapter 14 LOW-POWER DESIGN

- Chapter 15 MEASUREMENTS AND SIGNAL PROCESSING

- Appendix A The oscilloscope
- Appendix B Math review
- Appendix C The 5% resistor color code
- Appendix D 1% precision resistor values
- Appendix E How to draw schematic diagrams
- Appendix F Load lines

Appendix G Transistor saturation
Appendix H LC Butterworth filters
Appendix I Electronics magazines and journals
Appendix J IC prefixes
Appendix K Selected data sheets

I apologize to the net for the bandwidth, but my note bounced and couldn't find N4WMT in the call book.

Hi Bill,

You made it through the network just fine. I was not able to make it back to you via E-mail.

Yes, I'm willing to share my 8-bit Atari programs. Most of my stuff is for electronics. Much of it has been typed in from mag articles and from Howard Berlin. I've also written some for particular applications.

What kind of programs do you have for the Atari?

It it will be easier to contact me via U.S snail-mail.

I'm posting this for Tom N5OFF:

I have been doing some experimenting with my th-27a, and have found it to be an excellent aircraft receiver as well as a fine two meter transceiver. It will also do full 136-174 MHz tx/rx, but I have not yet found a mod configuration that will allow full tx/rx AND aircraft receive at the same time (except the asian config which I will describe below).

When modified for full 136-174 tx/rx in any of the western configs the aircraft am is defeated (see chart below).

In the asian config, the rig becomes a versatile wide band receiver displaying 118-174, 200-400, and will tx 136-174.
The problem with this config is that some of the keyboard positions become relocated (see cross reference), and the processor reset defaults to 145.000 instead of 144.000.

So, can anyone out there shed some light on how to get full 136-174 tx/rx and preserve the relatively high quality aircraft receive present in the western standard models?
I have included below my summary of the resistor combinations that I have either tried, or otherwise know the functions of.

Any further info will be appreciated.

R334	R335	R337	W301	REMARKS
o	-	o	o	k,p us stock config
o	o	o	o	e 144-146 tx/rx no aircraft
o	o	o	-	e2 136-174 tx/rx no aircraft
-	-	o	o	m 144-148 tx/rx no aircraft
-	-	o	-	m2 136-174 tx/rx no aircraft
o	o	-	o	x not tried
o	-	o	-	us mars 118-174 rx 142-152 tx
o	-	-	-	us mars+ 136-174 tx/rx no aircraft
-	-	-	o	asian or jap stock
-	o	o	-	asian mod 118-174,200-400 rx,136-174 tx
o	o	-	-	not tried
o	-	-	-	not tried
o	-	-	o	not tried
-	o	-	o	not tried
-	o	o	o	not tried

"o" means resistor or jumper in place
"-" means open

TH-27a to TH-F27 (asian version) key relocations:

	th-27a key	=	th-f27 key
	tone/tone sel		call/c-scan
	call/c scan		bell/step
	3 talt		3 tone
	shift/rev		rev/shift
	MHz/step		MHz/band switch {118,145,340}
f1sec,3 :	tone alert sound		tone select

I have done the japanese mod on my th-27a, and find that the button differences are easy to live with. All functions on the rig seem to work in the japanese config except I don't think the auto-dialer will dial a * or #. No big deal for me. It will manually send a # or * though.

As stated earlier, the coverage of the rig in the jap config is

118-136 am rx
136-174 fm tx/rx
200-400 rx

I don't think the 200-400 works at all because I've compared it to strong local signals on a scanner and heard nothing on the th-27a. Aircraft rx is great! As good as a Bearcat 100/200, and better than the Icom 2sat. The th-27a has a "real" am detector/agc (see schematic).

To sum up: I love this little rig!

> addition. And it's also largely a problem with ALTnet and ALTnet only.

That's right. If and only if the benefits of change are greater than the cost is the change justified. In this case, it is not. The cost of any change is the effort to implement that change.

> >   Hmmm. News.*, comp.*, rec.*, talk.*, sci.*. Rec.ham-radio seems to fit
> >quite well in the rec.* hierarchy.

> Yeah, the same what alt.swedish-chef.bork.bork.bork does.

This is a problem with alt. In one breath you differentiate USEnet from alt, and in the next you don't. Be consistent.

> This does not justify having ham-radio as a second level domain, which is the
> principal contention.

What justification is needed?

> >   Moving rec.ham-radio down under rec.radio will do nothing to reduce
> >the growth.

> Never claimed it would. It does however make that growth easier to manage.

No. It will be just as easy under rec.ham-radio as under rec.radio.ham.

> > Imagine, any site
> >not wanting rec.ham-radio.legal need do NOTHING, versus creating a new
> >set of groups and deleting old.

> Contradiction #1. You claimed earlier that it was a royal pain to hack the
> distribution. Now you claim that they "need do NOTHING". Uh huh.

No, read what I wrote. If you do NOT want rec.ham-radio.legal, you need do nothing at all. If you do not want rec.radio.ham.legal, you will still need to mangle the news feeds to get rec.radio.ham. There is no contradiction here.

> No, there's not status associated with domain level. The justification for
> hanging the ham-radio tree under the radio tree is both intuitive and
> obvious.

In your opinion. Above you say there is no justification for the status of ham-radio being at the second level. Here you say there is no status. This seems to be a contradiction.

> The usual cause of "junk" filling up is a mismatch between your distribution
> and you active files. Bnews (and presumably Cnews) junk articles that they
> can't find an active entry for.

Yes. I know that.

> If your "junk" is in fact your highest
> volume newsgroup, then it sounds like your site is misconfigured.

Or the feed is misconfigured. I have very little control over how they configure, other than asking them to change things. They have already told me "that's the way things are". I am guessing they are feeding me the same groups that they feed others, to make life simple for them.

> Remember,
> just because "you" don't subscribe to a group doesn't mean the system won't
> keep the group around for others to read.

Yes, because I don't subscribe DOES mean the system will NOT keep a group around for others to read.

>
> The purpose of the hierarchal structure of USENET is to divide posts into
> meaningful structure. What goes on in r.r.n has little to do with Amateur
> Radio (read the group charter). Moreover, your suggestion of "taking it
> over" is childish at best.

So your claim that r.h.* is closely related to r.r.* is not supportable. I think your suggestion to rename r.h just to rename it is childish at best, but I try to argue based on the argument and not on the personal characteristics of those I argue with. What, run out of rational arguments already?

> It's quite clear that noncomm has little if anything to do with ham radio.
> It is quite clear that ham radio has something to do with radio. At least
> the last time I took E&M it did, anyway.

Of all the rec.radio, ham-radio is supposed to be the least commercial. Even PBS stations are running adverts these days ("This program was funded by ..."). So, we are more noncomm than noncomm. The noncomm name fits us better than those who are there now.

> There is no difference in difficulty between adding rec.ham-radio.legal only
> and adding and deleting four newsgroups. You still have to enter emacs
> only once, if at all.

No. You must edit your active file. You must send mail to your feed to tell them to send you the new groups. If you feed someone, you have to edit the file that says what you feed (if they don't take everything already). That's at least two edits (my mail editor is emacs), maybe three.

> On the whole, the name change is more of an administrative change than
> anything else. If nothing else, it allows for a more logical growth
> in the tree structure for future splinter groups off of the ham radio
> discussion section.

You made this claim before, and it is still as false as it was then. It does nothing to allow a more logical growth. There is NO DIFFERENCE between adding groups under rec.ham-radio and adding them under rec.radio.ham. None. Zip. Nada. If rec.ham-radio can't grow logically as rec.ham-radio, then it can't grow logically under rec.radio.ham. Once again, the whole argument comes down to claims that are not supportable.

And this will, of course, upgrade all Technician licenses to General, as the only difference is the code test. 80m phone, here I come!

Newsgroups: rec.ham-radio
Subject: Alternative proposal - The Grand Radio Reorg
Message-ID: <9k1yT5w163w@phoenix.com>
Date: 10 Dec 90 15:51:55 GMT
Organization: One Man Brand
Lines: 95
Posted: Mon Dec 10 16:51:55 1990

Since there is a great hullaballoo about reorganizing rec.[ham-]radio, let's go the full 9 yards and have a grand reorganization. Following all the arguments pro the change, here is a new proposal that will actually do what the old one is claimed to do.

Deletions:

rec.ham-radio[.*]
functions to be assumed by new groups

Additions:

rec.radio.noncomm.pro
the new home for the professional, non-commercial radio discussions.

rec.radio.noncomm.amateur
the top level for the discussion of amateur uses of noncommercial radio.

rec.radio.noncomm.amateur.ham
the top level for the discussion of topics relating to

the Amateur Radio Services, and the equivalent services in non-US countries.

rec.radio.noncomm.amateur.ham.misc
This group replaces rec.ham-radio. It removes traffic from the domain, so that there are no groups that carry traffic and serve as home to subgroups.

rec.radio.noncomm.amateur.ham.digital
this group replaces rec.ham-radio.packet, and includes other digital modes.

rec.radio.noncomm.amateur.ham.swap
this group replaces rec.ham-radio.swap

rec.radio.noncomm.amateur.ham.rules
a new group for the discussion of regulatory issues, including but not limited to code/nocode and PRC1.

rec.radio.noncomm.amateur.cb
a group dedicated to the discussion of the uses of the Citizen's Radio Service, or equivalent in non-US countries.

rec.radio.noncomm.amateur.lowpower
a group dedicated to the users of devices classed under Part 15 of the US rules, and the equivalent in non-US countries. A major component of the charter for this group is the dissemination of the information that baby-monitors can be monitored by anyone.

alt.ham-radio
a starter group that will allow anyone who wants to create any group he or she wants, under the umbrella of ham radio. Possible immediate new groups:
- alt.ham-radio.spark.gap.zap.zap.zap.
- alt.ham-radio.morse.code.dit.dah.dit
- alt.ham-radio.reorg.of.the.week

Rationale:

This reorganization will serve to identify more completely the groups, and allow easier growth. It provides areas for the discussion of topics not currently covered. As ham-radio is a non-commercial usage, it falls most logically under the noncomm name, and more specifically, under the amateur usage of radio spectrum. This will, hopefully, serve to reduce the discussions of the commercial or professional usage of Amateur Radio in the amateur.ham.misc group.

To better identify the professional users, and to separate them from the amateur traffic, a new group is formed for them. This eliminates the problem of having a domain that also carries traffic. This is the same reason for the creating of the .misc group under rec.radio.noncomm.amateur.ham.

Note that the term amateur is used in its generic form. The usage matches that used by non-hams. (Those poor souls who would like to become one will identify first the noncomm heading, followed by the amateur heading, and finally the actual ham group. Those searching for CB will be able to easily locate the CB groups.)

Since this proposal actually does what the proponents of the other proposal claim, they should be quick to accept this. If we are going to change, we should at least do what we claim we are trying to do. If you have trouble with this proposal, then you should really be having trouble with the rec.radio.amateur one.

Given these articles in SpaceNews:

> * SAREX NEWS *
> ==============
> Dr. Ron Parise, WA4SIR, has made hundreds of packet radio contacts with his Amateur Radio station on board the space shuttle Columbia. Telephone bridges were set up to enable school children to talk with the latest ham in space. Ron has also been making some voice contacts. The primary downlink frequency for all SAREX operations has been 145.550 MHz.

* MIR NEWS *
============
Soyuz TM-11 has successfully docked with the Mir space station complex currently on Earth orbit. The Soyuz spacecraft carried Soviet cosmonauts Musa Manarov, Viktor Afanasyev, and Japanese journalist Toyehiro Akiyama.

I was wondering: If there are hams in the shuttle and hams in Mir, both running 2 meters, have there been any space-to-space (ham) QSO's?

I realize that the altitude of the orbits is not enough to provide significant mutual windows but the shuttle and Mir do occasionally pass close enough to see each other. Last week I heard that they passed within 30 miles of each other so it certainly is possible.

(maybe this time the Russians were too busy babysitting that whining journalist...)

Actually, this is very unlikely, because there has not been a Notice of Proposed Rule Making (NPRM) for any such action.

>Ironically, if this rumor comes to pass, I could easily find myself
>running CW only. I can hear the displaced CBers stirring now, as the

Exactly. CW may be a better "lid filter" without the exams than with
them, as long as there continue to be substantial CW subbands.

I don't have any problem with people who disagree with League actions.
I often disagree with them myself. What I have a problem with is
people who a) distort League actions and policy statements to make
their own case, and b) disagree with *everything* the League does
just because it's the League doing it.

> credibility to your statements?

I think I twice mentioned talking to the FCC, so I guess that constitutes
"repeated references." But I thought folks might want to hear from

someone who actually has taken the time to talk to the FCC and find out what they really think, rather than making wild guesses. Sorry if what they told us doesn't fit with your preconcieved notions.

If you don't understand the difference between speaking *for* the League and my speaking *as* a League staffer, I suggest you consult a dictionary.

> Right. Brand everyone who disagrees with Newington as troublemakers and

> embarrassing questions like, "Now that the loss of 220 - 222 mhz is final,
> who was it at HQ who failed to see to it that the FCC technical people had
> constantly updated rather than outdated ARRL repeater directories?"

People who want to debate issues aren't troublemakers, but people who make irrational and unsubstantiated charges are.

Speaking of red herrings... the date of their Repeater Directories is irrelevant since the Directory doesn't (and isn't intended to) provide band-occupancy data. Their misuse of the published information could as easily have been done with any year's Directory (including the current one).

I don't think I'll post any more on this thread. While I'm sure the net readers are hugely entertained by it, I doubt it's adding much of value to the legitimate debate of ham radio issues.

```

I just passed my novice test Dec 1 ! I am now working on my Tech!

I would greatly appreciate any advice an recommendations on setting up my shack, and purchasing radios and attennas. I plan on making my own antennas since most people I have talked to say that it's easy, inexpensive, and that these antennas get excellent reception. So my main concern is the eternal question: Which rig? I want to work phone on 10 meters as soon as possible since propagation is so good! I also want to do some CW and hope to eventually get my general license! There are so many different brands and models of radio! It's all very confusing. I also want to do packet sometime.

I've been told most transceivers are general coverage now? Is this true ? If not, would it be cheaper to get a ham bands only transceiver? Looks like I need an allmode all band HF rig. Any recommendations? Someone recommended the ICOM 735. Comments? How much would it cost used? Any other recommended brands or models? I am CS major that tends to like features and "gadgets" I think my personal preference would be an LCD display for the frequency, but I am told that it is sometimes better to get an analog tune.

Thanks in Advance!

I have not been involved with amateur radio for many years. I would like info on packet switching, ham BBS and possible access to USENET and INTERNET. Please reply via EMAIL and I will summarize responses, if warranted.

Thanks in advance.

I agree with the current proposals to split rec.ham-radio into smaller subgroups. I am less concerned about what the subgroups are than about the need for doing it. It is just too big now.

I'd rather see this too.

I'd also like to see rec.radio.cb so that CB related stuff would have
a place to be without being flamed to death and rec.radio.amateur.tech
(or perhaps just rec.radio.tech since the shortwave folks would also
be interested in the same things) for technical discussions.

We just got through with a nice 82 degree high pass here in Honolulu. It peaked at 7:54 pm local time tonight, December 7. I made sure that plenty of people heard about it by talking it up on the statewide repeater system. Everyone expected a loud packet pass.

I went up on the roof of my condo, about 100 feet AGL, with binoculars, handheld, and 4 element beam. Invited some neighbors to come look for the shuttle and listen to the commotion.

Unfortunately, it was too long after sunset, so no one spotted the shuttle.

However, WA4SIR surprised us all by coming up on voice! Several astonished hams managed to make contact during the pass. I heard about 2 minutes of the downlink with my IC-2A and 4 element handheld beam, and a visiting ham in Waikiki heard WA4SIR on a handheld and ruber duck!

Gee, I wonder if Ron just wanted more DX QSL cards? *grin*

Jim, I'm hardly in the class of ivory-tower technical tinkerer. I intend
to participate in rec.{ham-radio,radio.ham,radio.amateur}.legal. I do
recognize that not all readers of this group do, though.

Jon, this is the kind of thing that should go in .legal. Glad to see that
it's making an impression. .flame would be ideal, but would never fly in
the newsgroup creation process.

Who do we need to talk to about spliting rec.radio.shortwave and ham.radio?

At the moment some items posted in ham.radio automaticly also make it into radio.shortwave.

I subscribe to both and do not really want to read them twice.

Is the magic word here, BANDWIDTH.

In the library world, this is known as "Dewey Decimal Syndrome" - a
strange neurotic compulsion to categorize things down nearly to the
finest grain, regardless of the usefulness of the categorization to
those people attempting to use them.  This is a mild case, but clearly
it's the thin end of the wedge.

Should there be created such a group as .legal (or .pilpul, or whatever)
how many are going to subscribe to it?  Or is this just a thinly-
disguised case of NIMBY - an attempt to get all those people who insist
on talking about legal issues to go away and stop bothering you?

A brief reminder as well: dots in newsgroup names indicates branches in
the tree-structured hierarchy of groups.  They're not just namepart
separators.  The dash character is more appropriate for that.

Finally, I'm moderately proud to be called a "ham radio operator";
I think it's nicer than being called an amateur (as opposed to
"professional").  I think the people who want to be called 'amateurs'
instead of 'hams' are being overly formal - like insisting on being
called Robert instead of Bob.

I love to modify radios but I thought I might add my 2 cents worth here. Everything you say here is correct but this mod will not buy you anything. With a 4KHz filter your radio will still receive 4KHz worth of spectrum, only about half of which will ever be the intended SSB signal. Shifting the BFO to the low side of the IF <will> enable USB only reception, but it will be just as noisy. As you suspected, you need a more narrow filter (about 2.4 KHz for SSB). I think I would leave the BFO centered and still

be able to copy both sidebands. If you want to know which sideband you
are listening to, remember this: If you shift the frequency <up>, a USB
signal will go <down> in pitch and a LSB signal will go <up> in pitch.

I've been wondering whether it would be easy to build a 2m/440
duplexer like the kind that Larsen sells, or they type which
is made by Diamond or Kenwood?

I haven taken one apart yet but I assume that all they contain is
a ferrite core and perhaps a few stragegic windings?

Can anyone post a diagram of a simple duplexer for this purpose?

with the Space Shuttle Columbia.              { This is my confirmation!   }
                                               ^^^^^^^^^^^^^^^^^^^^^^^^^^^^
```

Equipment used: Yaesu FT727 HT, a 25 Watt brick, 100 feet of RG-8X, and
                 a homebrew J-pole at 100 feet. Approximately 10 Watts EIRP.

Interestingly, KA6NEI had a QRZ message in the first pass that said he already had QSO # 1056. But the QSL beacon had him as being QSL # 1076.

The next pass had no sign of KA6NEI in the beacon, even though his connect was one number away from mine (his 1137, mine 1138).

The way I see it, either his DM packet wasn't heard, or his connect was tossed out by the robot after it checked for dupes.

There has been some amount of confusion locally as to whether the robot is really ignoring the dupes, since it has been assigning new QSO numbers on each pass. Anyone who knows for sure, please let me know what's going on.

Aloha, hope everyone that tried managed to get through to STS-35!

de KJ9U, John Shalamskas

In the course of researching the demise of the carrier pigeon as a species, I was recently reading an offical Signal Corps history of their involvement in W.W. II. Just out of a sense of boredom,(I've been working on this project TOO LONG!) I started to look up references to amateur radio. The history had glowing things to say about the Amateur Service, including a report filed after a visit to ARRL headquarters in (then) Hartford, Conn., and the formation of the Army Amateur Radio System (AARS, which I assume is the precursor to MARS). The book continues with saying that "the attack on Pearl Harbor, of course, ended all amateur radio work in the United States", and just drops the subject. I can't find any more references until far after the war was over. In a word, what happened? I can't find any other sources to back this amazing statement up. Did every amateur station in the country go into mothballs "for the duration" ? Did Congress (or the governing body of amateur radio) just outlaw all ham transmissions? By what reasoning? It would seem to me that amateurs, particularly those with fox-hunting experience, would be quite useful to combat domestic spies, etc, etc, etc.... Any of the older hams on the net remember this time period? What happened?

Perplexed,

R. Todd Perry

Y'know, for the first time ever, I've decided that it might be a good thing if amateur radio finally became a thing of the past...

Yesterday (a Friday) I was home sick, so I thought it'd be really nice to copy the PA0AA/PI4AA club bulletins on twenty (14103). These guys have been on the air for about thirty years now, same time, same place, and I've sent them the odd report now and then for almost twenty of those years.

So I'm copying their Dutch news xmission (cw) and one of God's divinely appointed american amateurs (at least in his mind) shows up. Anyway, asshole starts sending (keyboard generated) cw over PA0AA, asking 'em to please QSY to the cw portion of the band. This does no good of course, 'AA is sending tape/whatever itself. Still, he keeps it up for the entire cw news broadcast, of course, he gives no callsign.

So, time for the voice portion of the transmission.

Two people show up on voice (both sounded like older people) asking why they have to listen to this every Friday afternoon. No calls again, what's the odds one of these two was the cw policeman? They carry on bitching and whining......and bitching...and whining...

I used to think that amateurs were slightly special people - y'know - interested in things outside their back yards, willing to help fellow hobbyists, generally tolerant folk. Turns out that being an amateur just gives you the ability to be an asshole with an audience of thousands if the fancy takes you......and those of us that tolerate these people are every bit as bad because we can't be bothered to do anything about it!

God, I'm pissed! What with the zoo on 313 and Bouvet, perhaps we really don't deserve to be allowed to exist as amateurs. I used to say that the 313 zoo made me proud to be an amateur........"G" amateur, that is, but I'm not even sure of that any more.

Okay, anyone have any suggestions upon which we can act to clean up our act? The ARRL and the FCC don't care, so perhaps it's time we got our own house together?

Oh, I live in NH, not G-land, by the way so I've seen both sides of the US/EU hf attitudes.....

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

> I'm talking about, and it has nothing to do with "sharks" and "guppies."

And I was talking (as well you know) about the immorality of the FCC using
beating up on us guppies as a smokescreen to hide the fact they can't/won't
deal with the sharks. In fact, by failing to deal with the shark class
violations, they encourage guppy class violations. If they'd deal with the
sharks, the guppies would take the hint.

> > Are we to infer from your constant references to the fact that you

Neither does your predilection for trying to drag red herrings across the
path of everyone who is less than totally thrilled with the way the League
mismanages things.

> Also, as you very well know, my postings
> here do not represent official League policy.
> If people insist on
> taking
> anything any ARRL staffer or official says as "League policy," how
> can there be any dialogue between the officials/staff and the members?

Then why do your postings in this thread contain repeated references to your part in the briefing of FCC staff members by ARRL staff members? If you're not speaking for the League, why drag its name into the conversation to lend credibility to your statements?

> (For some reason, I'm really starting to warm up to the idea of
> rec.ham-radio.legal. Although rec.ham-radio.flame seems more
> apropos.)

Right. Brand everyone who disagrees with Newington as troublemakers and segregate them into some ghetto where noone will notice when they ask embarrassing questions like, "Now that the loss of 220 - 222 mhz is final, who was it at HQ who failed to see to it that the FCC technical people had constantly updated rather than outdated ARRL repeater directories?"

The S.S. Ham Radio has hit another iceberg and is sinking by the bow, but by God, the officers on the bridge are in full uniform and saluting in proper Bristol fashion to the very end.

I'm not arguing against changing the name, but at the same time I think you underestimate the degree to which 'radio ham' has over the decades become a widely understood term among non-hams.

What is the real progress? Changing the name from rec.ham-radio to rec.radio.amateur is not progress of any kind, much less "real". It is just "change".

Since there was an affirmative reply to the post of one site against it, then there are obviously TWO sites. If there are TWO, then there are probably more.

In fact, EVERY site will have to go through the trouble of changing the newsgroup names, feed and fed information, etc. All for what? A simple name change? Will this happen without incident? Ha ha ha.

The only real change is the addition of a .rules or .legal subgroup, which could be done WITHOUT any other name change.

Your post is yet another wild claim of perceived benefit with no justification provided, and it the only utter nonsense here. I have asked several times for a real justification for this change, and NOBODY has answered. The only "reason" so far is "it's a new name". So what?

Will it stop the cross posts? Hardly. Does it describe anything better? No. Will it change ANYTHING, other than the name? Ha ha ha. No.

Your claim that a name change is real progress is the same as claiming that all New York City needs to do to solve it's problems is rename itself to South Bend, Indiana.

Fine, but if you come to me after Phil finishes his Phatasmagorical Data Engine and ask "How come we got no bands to use it in?", am I ever going to unload on you!! [:-)*

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

I'm not arguing with the logic of the mechanics. I'm arguing against the attitude that produced the desire for the new mechanics. I believe that it is dangerous to believe that ignoring the very real political problems we face will make them go away.

One troubleshooting tactic, strange as it may sound, is to turn the rig on with someone watching the TV set with the TVI, and go about whacking on things metallic. Disturbing the metallic oxide junction should produce a radical change in the TV display.

To avoid being fitted for a sports jacket with wraparound sleeves, do this at night while meowing loudly. On second thought, send someone else to do it.

```

Doubtful. In the first place, how do you prove it? All the police chief has to say is that he was gathering traffic flow statistics.

In article <oHqVT4w163w@phoenix.com> stanley@phoenix.com (John Stanley) writes:

> In fact, EVERY site will have to go through the trouble of changing the newsgroup names, feed and fed information, etc. All for what? A simple name change? Will this happen without incident? Ha ha ha.

This is, of course, false. For starters, the vast, vast majority of sites take everything. The next most common layer gets rid of the talk groups, and the one after that, soc and rec. So, the actual number of sites that will have to make adjustments to their distribution file is very small.

About five years ago, USENET went through a very major name reconstruction, for the most part without incident. Frankly, the proposed shift should have been done then, but that's hindsight.

> Your post is yet another wild claim of perceived benefit with no justification provided, and it the only utter nonsense here. I have asked several times for a real justification for this change, and NOBODY has answered. The only "reason" so far is "it's a new name". So what?

I went into this extensively about three months ago. To reiterate, the change is necessary to better integrate the newsgroups into the developing USENET hierarchy. USENET is not a static entity. The population is growing exponentially, and the number of groups is growing linearly with time.   Thus some tendency to order is justified. There is no good justification for RHR's second level domain status, as the tree that is developing under it is directly related to the tree growing in rec.radio. Given that rec.radio is the better organized tree, it only makes sense to direct growth of the smaller tree (RHR, and growth into rec.ham-radio.legal) off of the other tree.

> Will it stop the cross posts? Hardly. Does it describe anything better? No. Will it change ANYTHING, other than the name? Ha ha ha. No.

Empirically not true. While .d groups have not drawn off all of the flames from the mainline groups, they have been for the most part effective. Frankly, the ham subculture of armchair lawyers is pretty well defined (I say that being one of them); there are some people who do NOT want to be part of that subculture. The flames resulting from a few thoughtless crossposts should be enough to pen in the obnoxious.

> Your claim that a name change is real progress is the same as claiming that all New York City needs to do to solve it's problems is rename

>itself to South Bend, Indiana.

Similar claims were made during the aforementioned Great Reorg, as well as the Internet move to domains a few years back. Remember host tables?
Heh, thought so...;-)

SpaceNews

MONDAY DECEMBER 10, 1990

SpaceNews originates at KD2BD in Wall Township, New Jersey, United States.
It is published every week and is made available for unlimited distribution.

* SAREX NEWS *

Dr. Ron Parise, WA4SIR, has made hundreds of packet radio contacts with his Amateur Radio station on board the space shuttle Columbia. Telephone bridges were set up to enable school children to talk with the latest ham in space. Ron has also been making some voice contacts. The primary downlink frequency for all SAREX operations has been 145.550 MHz.

* MIR NEWS *
============
Soyuz TM-11 has successfully docked with the Mir space station complex currently on Earth orbit. The Soyuz spacecraft carried Soviet cosmonauts Musa Manarov, Viktor Afanasyev, and Japanese journalist Toyehiro Akiyama.

* OSCAR-21 NEWS *
=================
The launch of AMSAT-21/RM-1/RS-14/RUDAK-2 has been postponed until 07-Jan-91 so that a Soviet official may witness the launch.

* FEEDBACK *
============
From Franklin Antonio:

In article <378@ka2qhd.UUCP> kd2bd@ka2qhd.UUCP (John Magliacane) writes:

>* MINI-TUTORIAL *
>=================
>The first person to investigate elliptical orbits thoroughly was the mathematician and astronomer Kepler. He formulated a set of rules for elliptical orbits and was able to demonstrate that all planets followed such orbits in their motions around the sun. Over 100 years later, orbital elements defined by Kepler are still being used by astronomers and satellite trackers worldwide.

Actually, it was a __long__ time ago. Kepler published his work on elliptical motion in "seu Physica coelestis tradita commetariis de motibus stellae Martis" in 1609! This contained the first two laws: orbits are ellipses, and equal area = equal time. In 1619, he published "De Harmonice Mundi", containing the third law, which relates distance to orbit period. In 1620, his mother was arrested for witchcraft.

So, the basic work was done 371 years ago! This is one of the humbling things about celestial mechanics. I'm sure I wouldn't have been able to figure this out, yet Kepler did it 371 years ago. Obviously, he didn't have computers. Most people don't realize that he didn't even have the benefit of a telescope. The telescope was invented around 1609; Galileo pulblished in 1610. The observations that Kepler used to develop his theory were made by Tycho Brahe, many years earlier.

===

John,

Thank you very much for your Keplerian elements tutorial in SpaceNews (90-12-03). You know, this was the first time I have seen any explanation of what Keplerian element sets actually represent, in sufficent enough detail to permit me (or anyone else, for that matter) to write tracking software.

This is so true. I just leave tone on for all repeaters, programming the
lowest tone possible for repeaters that don't require tone. Nobody notices.

easy. Committed suicide by literally walking out of a window ten stories
up. Seems he just wanted to give up fighting for the rights to own FM.

Too bad. If he lived, he could've seen that he won in the end, and see
the rise of FM in this country.

The FCC isn't going to approach the department without proof that they were using dummy radar. When an FCC engineer goes to one of the radar gun sites, he'll see a radar unit sitting there, with probably a gel cell or something powering it, and that's it. If the PD was gathering "traffic flow statistics", they'd need some means of recording the statistics they gathered, i.e. either some type of computer with a storage device, a printer of some sort, etc.

Also, when agencies like the Department of Transportation or the National Highway Traffic Safety Administration set out to get traffic statistics, they use special radar guns that are not on the standard X or K frequencies for the sake of getting unbiased readings. If they used standard guns, they would set of detectors, and they would end up getting averages below what is typical.

IMHO, an FCC engineer will recognize this ploy as pure BS.

In a word, yes. Hams exist at the mercy of the federal government and the military will always have the right to usurp any and all of our frequencies. This month's (December 1990) QST has a very good summary of the history of amateur radio that will provide a much better answer than my typing.

Keywords:

I am interested in buying a Cushcraft R5 20/17/15/12/10m vertical. If you have used it, please mail me your opinion of it. I am particularly interested in how high it must be mounted to avoid interaction with metal below it. I will be mounting on a apartment roof with metal siding around it. Cushcraft claims the R5 only needs 6-7 feet of clearance to avoid interaction with objects below the plane of the radials. I am also interested in the effiency of the antenna. Thanks in advance.

IMHO, no FCC engineer is really going to care anyway.

and besides, If the radar gun is on it's performing radio telemetry.
It doesn't matter if you're looking at the readout or not. If an air
traffic controller looks away from his scope is he breaking the law
too?

I don't think it would be too difficult to convince the powers-that-be to make amateur radio a thing of the past. It seems to be getting so that it is virtually impossible to conduct any type of useful scheduled or organized activity on ham radio due to QRM, both deliberate and unintentional.

For example, I was listening to the WA3NAN (Goddard Space Flight Center) space shuttle audio rebroadcast last Sunday night. There was a station sweeping his VFO across the frequency sending di-dah continually. Later, a couple of stations got on the frequency and started a QSO; hearing WA3NAN but not knowing what it was. (These guy probably hadn't read QST in 30 years.) They refused to move when another ham got on the frequency and politely explained what the broadcasts were, why they were legal, and that they were of interest to large number of amateurs. The two didn't think that these broadcasts belonged on ham radio and carried on, ignoring the fact that they were needlessly annoying lots of other hams. This was "their" frequency for "their" sched. A 3rd voice then jumped in and added that that WA3NAN was at fault, since it was supposed to be on 3860, and this was 3858.

My feeling is that the only reason ham radio still exist is because of the many instances we've documented where we've saved lives in disasters and provided public safety communications. If we lose the ability to provide these communications because certain people disagree with them and cause QRM or because other people are so out of touch with the happenings in ham radio that they don't even recognize a disaster net in progress and don't have the sense to QSY, we will lose amateur radio altogether. It is, for example, OK to question the validity of the 14.313 activity in the porper forum. But to QRM it only demonstrates our inability to provide orderly communications.

Many hams need to chill out a bit and realize that the airwaves aren't theirs exclusively. If the rag chewer can appreciate the fact that a great many hams enjoy contests, and if the DX-chaser can appreciate the fact that some stations actually enjoy QSOs with people in far away places that go beyond a simple "59" without having to endure accusations of "hogging the DX," methinks we will all be happier.

If (When) we make the switchover to rec.radio.{ham,amateur}.*, it might be a good idea to make a FAQ message and send it once a while.

It happens that once a while, a casual reader writes a message in the wrong group, the most common error seems writing in rec.ham-radio what should be in rec.ham-radio.swap.
Usually, this results in a flame storm to the mailbox of the offender, and sometimes on the net as well.

It seems to me that the distinction between rec.radio.ham and rec.radio.ham.legal is less clear than the swap group.
As a result, I think that more articles are mis-posted, and with the dynamic properies of this group, the flaming remains!

Also, a FAQ might give an answer to some flame-prone questions, like taking various equipment onto air flights, etc.
One question from an innocent beginner and the group is filled for the rest of the month!

Other thing: Like Brian, I too would like to keep 'ham' instead of 'amateur'. At least here, broadcast band pirates and the like also

call themselves 'amateurs'.
Moreover, I usually find a new interesting newsgroup from a list
with descriptions (like a checkgroups message), instead of just the
name. And, yes, I like 'ham' too, even if (or because) there is no
similar word in Dutch or German as far as I know of.

Finally, I'd like to propose 'rules' instead of 'legal'. Bandplans,
for instance, have no legal meaning here, just 'gentlemen's agreement'.
If discussed, I'd like to see that in the rules group, because
of the traffic involved. The way I see it, 'rules' is for all rules,
not just the ones issued by the government.

That's my stuiver's worth. I'm interested in your opinion.

RTTY DX Notes 1of3 12/7/90

RTTY DX Notes for week ending 7th December 1990
BID: $RTDX1207
Part 1 of 3.

Please, when reporting intended DXpeditions to some rare place, would the person reporting indicate where this rare place is? My geography is fairly good, but where the heck is Morokulien? Which brings me to another point. Considering present and past operations, one would assume that some of the DXpeditions have very little interest in RTTY. We had one to the north who worked very little RTTY, and one to the south who admitted that they were not interested in RTTY. One must ask, should we support these operations if we are to receive no benefit? Maybe we should have more RTTY only operations. At least it is worth thinking about.

Our thanks this week go to DJ3IW and the Saar-Pfalz DX Club Packet Cluster, I5FLN and his packet cluster, JA1BLV, OD5NG, TG9VT, VK2EG and WB8RJX. Thank you all for your excellent news. We do seem to be missing one of our regulars. Hope that the birthday was not too much for you Jules.

QSL Information:

ZS9Z/ZS1 says to QSL via OH2BH.

Continued in part 3.
/EX
SB RTTYDX @ ALLBBS $RTDX1207B
RTTY DX Notes 3of3 12/7/90

RTTY DX Notes for week ending 7th December 1990
BID: $RTDX1207B
Part 3 of 3.

C56/6W6JX says to QSL to Box 200, Kaolack, Senegal. Do not QSL to his manager for this operation.

ZB2JB will QSL via Box 292, Gibraltar.

PJ8DFS indicates that his manager is SM5AQD.

LU5DF/CX expects all his cards to go to LU5FSB, who will do the QSL chores.

XU1DK, Toru, says the short address for his QSL is Box 80, Koujimachi, Tokyo 102-91 Japan.

Notes of Interest:

XU1DK states that the power is cut off at 1500Z each day, which makes it a little difficult to operate after that time.

Kure Island, KH7, should show up as KD7P/NH7 from 12th December. He expects to be there until 21st December. QSL to his home address on Guam.

PA3DUU will operate from Morokulien with the call of LG5LG from 22nd December to 29th December. His QSL manager is LA9DFA. (Don't ask me where that place is.)

HA9RE and HA8XX are planning a South Pacific DXpedition toward the end of the year. They will start from Chatham Island as ZL0AAD and ZL0ADN. After two or three weeks they will go to Rarotonga for another two or three weeks, then they proceed to Niue Island as ZK2XA and ZK2XB for about the same period. QSL to DJ1ND. They would like some dontaions to pay for their trip.

3W3RR, Romeo, informs that his trip to Spratley will be delayed

because he now has permission to operate from Afghanistan, as YA0RR.
He expects to start at the end of December. He needs donations too.
Send them to Edward Kritki, Box 715, Brooklyn, NY 11230 USA. QSL
address and frequencies will be announced later.

I was wondering what procedures one has to go through to obtain a
US amateur radio license. I currently have a class A license (GW4WFX) in
Britain but will be in the US for a number of years where I am at grad.
school. Can I just get a reciprocal license or do I have to subject myself
to some other procedure.......??????

Any advice would be appreciated.

Nic.

I can't imagine why an educational institution would have trouble with anything to do with Amateur Radio! Maybe this shows how poor our PR is.

I know of one person locally who is currently doing this with the rec.ham-radio groups specifically. I am sure I'll be able to do so as well, once I get my machine (robohack) operational again, though I will probably want to restrict the service to the local area.

No, it is far from automatic. Someone deliberately cross-posted the first article. It might have been a question that was appropriate for both, at first. Then, as the discussion grew towards ham radio in rec.ham-radio, and towards the SWL side in r.r.s, nobody took the effort to un-crosspost the postings, so now you read the same thing in two places.

> I subscribe to both and do not really want to read them twice.

rec.aviation and sci.aeronautics suffers from the same thing. sci.chem and rec.pyrotechnics, at times. Life is a beach.

While I will agree that Newton established all the fundamentals for the CM, that he did grind the 2-body problem to dust, and that the science of CM is indeed four centuries old, I cannot agree to calling the later work "footnotes" or dismissing the following works as being un-verifiable.

This argument is similar to one that may be made in "showing" that all of science and engineering boils down to Physics, or that the only truly original discoveries appear in some esoteric branches of Physics, and everything else follows.

The point is not that the basic problem of CM has remained unchanged for the past four centuries. It is that all the variations on that problem have prompted some remarkable contributions from a large number of mathematicians, and more importantly, these contributions have had implications far beyond just CM.

>Doubtful. In the first place, how do you prove it? All the police chief has to
>say is that he was gathering traffic flow statistics.

I recollect that it started on I-75 in Kentucky. The local PD bragged about
it to the media when confronted. Someone requested an opinion from the FCC
which said that it was a No-No. The FCC did not cite them (as far as I know),
but they desisted.

Apparently they did. They terminated this practice in Georgia where they were using radar guns mounted to roadside poles. They also stopped the Pennsylvania State Police who had been putting old radar guns in highway maintainence vehicles, median lawn tractors, etc.

>and besides, If the radar gun is on it's performing radio telemetry.
>It doesn't matter if you're looking at the readout or not. If an air
>traffic controller looks away from his scope is he breaking the law
>too?

It doesn't matter whether or not somebody is looking at it. It DOES matter whether or not there is someone there to control the emissions. Radar guns aren't classified as telemetry equipment. The license is for radiolocation. FCC regs also state that this type of device must

be manned. Also, a radar detector is a radio receiver. If somebody
is interfering with its use, that is, somebody is setting it off without
a reason for transmitting, that is also an FCC violation. See part
15 for more info. Radar guns are part 15 devices, from what I remember.

Don't overcomplicate the problem! All it takes is an auxiliary officer with a
pencil and a notebook.

> Also, when agencies like the Department of Transportation or the

To find out the fans on the way home from the Michigan - OSU game are pushing it a bit? Come now.

> IMHO, an FCC engineer will recognize this ploy as pure BS.

An FCC engineer, even if he cared, we would be hard put to demonstrate that this is not VTO enforcement. The purpose of enforcement is to ensure compliance, not to rack up a lot of traffic court 'kills'. If the radar trips a few fuzzbusters while the watch commander is deciding whether to run a trap, well, that's life.

Errrr, what is not standard about rec.ham-radio? Other than the inhabitants, what is unconventional about it? It tells you right off what it is, certainly better than things like comp.sources.d (what, the next language after C?)

Just because there is a rec.radio.* is not a reason to change rec.ham-radio.

I had enough difficulty getting the University to enable the current
groups, changing things just makes life difficult. We will probably lose
the service altogether.
Mike.

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

Jim, that is unmitigated crap. Are you suggesting that, since the cops
can't stop every crime, they shouldn't mind the legalization of any
technology that makes committing a crime easier? That's exactly what
I'm talking about, and it has nothing to do with "sharks" and "guppies."

> Are we to infer from your constant references to the fact that you
> participate in the ARRL program to educate the FCC on what's happening in the
> real world that the League approves of this FCC "Whack the Guppies" policy?

Attacking the messenger because you dislike the message adds nothing
useful to this discussion. Also, as you very well know, my postings
here do not represent official League policy. If people insist on taking
anything any ARRL staffer or official says as "League policy," how
can there be any dialogue between the officials/staff and the members?

> [Sorry to offend the rec.ham-radio.legal proponents, but if you look up from

Give me a break.

(For some reason, I'm really starting to warm up to the idea of
rec.ham-radio.legal. Although rec.ham-radio.flame seems more
apropos.)

Hi All,
  Does anyone out there have experience with the COMPRESS utility used on
the mail archives? Specifically, I'm (trying) to run it on a VAX running
VMS 5.3, but I can't get it to link. I got a link on the Cray running
UNICOS, but then all I got was garbage out using a compressed mail file for
input.
  Please E-mail me directly with ideas/answers.

I need a (PD) morse code program that will run on a 386. I dusted off
a morse code program I bought for my xt in 85 and found it running in
the neighborhood of 120 wpm on my 386sx - a little too fast for me to
follow.

  Fine, so why did you have to post this message plus 5 parts of the actual
  program? Posting to all of the above list of newsgroups seems like a bit
  of overkill. In the future please post only the announcement and send the
  files by e-mail or post in a binary newsgroup. Not everyone needs or wants
  your software that reads these newsgroups, not to mention soem of us have
  computers that use other operating systems (Like AmigaDOS).

I just finished the stack I mentioned here a couple of weeks ago. It is available via anonymous ftp at joker.optics.rochester.edu (128.151.240.1). I have also mailed copies to those who requested it last week. If someone who has no ftp capability wants a copy, I will be glad to mail it to them. Below is some information about the stack.

DX Map 1.0 by Len Saaf, NV2Z
A Hypercard stack for the Apple Macintosh.

The stack is freeware. It may be distributed in part or in whole provided that it is distributed for free.

The stack requires Hypercard 2.0.

DX Map features:

* Your QTH is marked on the map and your local time appears above it

* UTC is displayed at the bottom of the map

* A DXCC country can by selected by either choosing the country name from a list or by entering a callsign or prefix. The DXCC country is marked on the map and the following information is listed:

    * Country name
    * Continent
    * CQ zone(s)
    * ITU zone(s)
    * Distance from your QTH in miles and kilometers
    * Bearing in degrees from your QTH
    * Callsign allocation
    * The local time in the DXCC country is displayed above its location on the map

* Your location and a remote location are fully configurable

I wrote 3 XFCNs for this stack:

* "CallToNum" takes a callsign and returns the number of DXCC countries that could have that callsign followed by ID numbers for each of those DXCC countries.

* "NumToInfo" takes one of those ID numbers and retrns a bunch of info for that DXCC country. The info is from a list I got off rec.ham-radio.

* "coords" takes 2 lattitude/longitude pairs and returns the distance between them and the bearing from the first to the second.

The source code to these 3 XFCNs is free for the asking. They are written in Pascal.

All bug reports, comments and/or suggestions are welcome.

73,
Len
NV2Z

Thanks for the clarification on "rec.radio.ham". I revise my opinion to supporting:

```
    rec.radio.amateur    [I hate the word 'ham']
    rec.radio.amateur.rules   or    rec.radio.amateur.regs

    and, of course,

    rec.radio.amateur.swap
```

rec.radio.amateur.packet

HELP! I need an "outside" antenna. My "temporary" attic dipole is driving me crazy. After putting ferrite beads and caps on my alarm siren I can run about 40 watts on 10 Meters before I drive it (alarm power supply disconnected) and 100 watts on 40 Meters if I get the antenna tuned really well. But my "smart" furnace thermostat consistently is reprogrammed when I transmit and tries to heat the house to 90 degrees. But enough of my sad tales...

I plan to put up a vertical mast 30 feet, and run a G5RV, plus perhaps a couple short dipoles at a later date. I think a tower might be a fight to get up, but think the mast with a few wires will be OK. My lot is somewhat triangular, 106 ft in back, 68 ft in front, and 100 ft deep. House is 43 ft from back fence. Plan is to use inverted V, with 10 ft mast sections (or house) at ends of wires.

I have heard that there are a couple variations on the plans for the G5RV. I would like to run coax through the attic to a balun under eaves, and then the open wire line to the dipole. I've heard of this both with and with out the balun. I'd like access to 80, 40, 15 and 10 meters at this time having a technician class license.

I'd like to solicit net opinion on the "ideal" antenna for my situation. And specifically on variations of G5RV design. All plans seem to use the 102 ft dipole, but what length of open line,

and 300 or 600 ohm open line, should a balun be used and if so
1:1 or 4:1, and what length of coax?

I'll summarize any replies coming directly to me. Thanks.

Did they really? I recall hearing about radar decoy transmitters, that
were being placed adjacent to highways to trip radar detectors. So
this is illegal?

I agree with Henry. Newton humbles us all. As for the following 370 years of
many-body perturbation and stability theory: bah! "plausible" and "could be"
are waffle-words. How can this billions of years stability stuff be science
if you can't test the result of the theory? Meet me in two billion years
for pizza. If it turned out that the solar system WAS stable, i'll buy you
a beer.

Richard Crisp asked me about the Drake R-7 receiver and I thought there may be others interested in this model.

I had a couple of Drake R-7 receivers, an Icom R-70 and R-71A (w/passband tuning), and an JRC NRD-525 (and TR-7A and TR-7s along the way, too :-]).

The R-7 is an excellent receiver and was tops in its day. It has more and better filters and passband tuning than the R-71A, R-5000, and NRD-525. It also has a low internal noise level because it was not fully synthesized. The R-7 is easier to modify and repair than the NRD-525, which uses surface mount technology.

The R-7's synchro-phase AM detector was great for listening to foreign broadcasts in a crowded band as you could use a reduced bandwith and listen to one sideband without sacrificing fidelity.

For utility monitoring, the R-7 has some drawbacks.

1. The R-7, R-7A, TR-7, and TR-7A employed permeably tuned oscillators (PTO) in which a core was moved in and out a coil. They drifted, even after 30 minutes warmup. I measured the drift on my Drake equipment over a 4 hour period but don't have the data handy. The drift is slow but would prove annoying to RTTY/FDM monitors.
2. The Drake 7 line had no memories or scanning. These features are very, very useful to CW/SSB utility monitors.
3. The 7 line had no squelch, something an SSB/CW ute monitor would miss.
4. The R-7 lacks an FM detector which more modern receivers have. I've listened on VLF FM to carrier

```
       current intercoms, and used HF FM receivers  with  con-
       verters.

  The R-7 is a classic receiver, still excellent  for  digging
  weak  signals  out  of a pileup, but not as flexible as more
  modern gear.

OK, is there support for this one? If so, I'll be happy to add it to the plan.
There has been occasional CB-related discussion in rec.ham-radio, and it has
proven to be a remarkable flame generator...

At the risk of repeating an earlier posting, Much of the stuff that we want to leave behind:

Code/No code

The legality of using a police autopatch to order a nuclear attack on a baby gay whale.

The thinly disguised broadcasting of hatred on amateur bands.

Etc. etc.

The people who are making the most noise on these things are probably far fewer than the numbers who read rec.ham-radio. They may be incapable of ever changing their opinions, but they are not stupid. They are preaching, trying to change everyone else to their viewpoint. when they realise that their audience are not reading -legal or -rules, simple - they just cross post to everything !

:-(:-(:-(:-(:-(:-(:-(

I hope this isn't old news. I recently picked up a DX-440-on-sale, as well as a service manual for same, and soon set about trying to figure out how to make it receive one sideband or the other.

After getting past a delusional fixation I had about needing additional IF filters, I tried someone's advice: use the narrow (4 kHz) filter, and shift the BFO up or down 2 kHz as is needed to receive the proper sideband. It works! And rather well, indeed.

Great, but to shift the BFO you will have to get inside the unit. The "BFO" control on the front of the DX-440 only shifts the 1st LO -- it doesn't affect the BFO frequency at all.

The one to twiddle is VT103 on the A-1 assembly, which is a 100 pF trimmer capacitor in the BFO xtal oscillator circuit. Of course, doing this means that you're stuck with one or the other sideband mode after you reassemble the radio case.

I'll be puttering around in the next week or two with ways to make the mode switchable, preferably with a minumum of holes cut in the case. I'll most likely use diodes to switch in another trimmer or two.

In any event, if you've been putting up with QRM while listening to the shuttle, the above adjustment might be worth it to you.

Later,

>>of solid-state power controls on your feeder, the AC waveform can get fairly
>>chopped up.
>
>Then what IS the basis for the 120V +/- 5% if not rms? Seems like the only
>fairly repeatable reading would be peak to peak...

You apparently mis-read the note -- it _is_ RMS, but very few meters really measure it. They respond to the average value of the waveform and are calibrated in RMS equivalent of a distortionless sinewave. You have to get one that is RMS responding -- those are specially marked RMS (and many are mismarked as 'true' RMS, as if there were any other kind). Digital meters are always mismarked as to the correct number of digits, but that's another story.

RCA used to make an expanded-scale (100-140 volts) ironvane repulsion Line Monitor (TM?) having nice ballistics to show line fluctuations.

>BTW, there is all sorts of interesting hash riding on the 60Hz sine wave.
>Solid state power controls may be the least of the problem; inductive
>loads can put a lot of crap on the waveform, too.
>
>-- Jerry Callen
>   jcallen@encore.com

Only when the loads vary, otherwise they just affect phase relationships. The power company doesn't like residential phase controls because it results in poor phase relationships that it doesn't normally meter and bill for. They would be worried if the phase controlled loads became a significant portion of the total demand.

I don't have the version number handy, but the latest 7K ROMs have
linking capability, improved flexibility in message processing (selection
of which xmtr to send the msg to) and more words for the voice synthesizer,
among other things. Call them at (303) 663-6000 for details. (It sounds
as if you've got a very early revision.)

I love to modify radios but I thought I might add my 2 cents worth here.
Everything you say here is correct but this mod will not buy you anything.
With a 4KHz filter your radio will still receive 4KHz worth of spectrum,
only about half of which will ever be the intended SSB signal. Shifting
the BFO to the low side of the IF <will> enable USB only reception, but
it will be just as noisy. As you suspected, you need a more narrow filter
(about 2.4 KHz for SSB). I think I would leave the BFO centered and still
be able to copy both sidebands. If you want to know which sideband you
are listening to, remember this: If you shift the frequency <up>, a USB
signal will go <down> in pitch and a LSB signal will go <up> in pitch.

I listened and listened and listened. Never heard it that I could tell.

What's the criteria for the two frequencies?

How much do you guys vary frequency off of one before going to the other?
Which one is primary?

(I want to scan between the two on my channelized receiver.)

Neither East Coast nor West Coast,

Ron

One question about this CMOS Super keyer: can the iambic feature
be turned off? I'm used to a W9TO style keyer, which I use
with a dual lever paddle. It is not iambic, and whenever I try
to use an iambic keyer I send garbage.

{
{   All in all, I've been very happy with the rig, my first foray into the
{world of 2m. The only bad things I have to say about it are
{
{1) The manual STINKS to high heaven. It's obviously a translation from
{Japanese, and it's more confusing than it is useful. It took me 3 weeks to
{figure out the DTMF/CTCSS functions.

Seems to be a generic problem with Alinco. My new DR590 manual (no charge from Alinco) is MUCH better than the original. Might be worth a phone call.

{2) Alinco has a good radio, but there are NO accessories available for the
{HT's. . . They shipped the rigs to get them on the market, but haven't supported
{them. A speaker/mike would be nice, as would DC adapters, etc...

You migh try Reno Radio (in Reno NV of course :-)) I don't have their phone number, but they advertise in QST. They seem to take extra trouble to stock Alinco stuff, a local ham got a DR-160 speaker/mike from them, then I got the DR590 remote control kit from them. Delivery from stock in both cases!

Someone here where I work was asking me for a recommendation for an inexpensive portable short wave radio. ("One of the new phase locked loop ones!") He saw an ad from a mail order place called DAK that is selling one for $50. I suggested he consider paying a bit more than that if he wants a decent one. Am I wrong? Can anyone suggest one for him? Thanks.

>

The current proposal does not split rec.ham-radio into smaller subgroups. All it does is rename the existing ones. Rec.ham-radio becomes rec.radio.ham. rec.ham-radio.packet becomes rec.radio.ham.packet. The only new thing is the creation of a .legal (.rules or whatever) group.

There are three groups now. The same three will exist, adding only the legal one.

A better proposal would be to simply add rec.ham-radio.legal. It accomplishes the same thing as the longer proposal does, with less work and confusion.

This seems exaggerated. I have been involved neither in actual ham radio
nor in the newsgroup, but have known the meaning of the word for ages.

Do you really want those who don't know what a ham is to post?

Whereupon Mr. Kaufman attempts to argue with said logic and concludes with the rhetorical,

>So which is it to be... road safety or more revenue?

This is getting well outside the world of ham radio, but still touches on something I find curious. When I got my ticket I'll have to admit to joining into a few sideband ragchews. One thing that struck me about the common mentality I tended to find there (American sidebanders) was precisely this authoritarian bent Dave Heller demonstrates wherein the collective good is presumed to be so much more important than individual liberties and is viewed as being so dependent upon the welfare of the individual that society as a whole (meaning, of course, government) has an obligation to restrict the individual's liberties in those areas where exercise of the liberties might allow him to do harm to himself. I think this was one of the founding principles of California, so it doesn't surprise me to see this in the locals, but it seems to me that this is also characteriscit of American hams in general, or at least the sidebanders.

By and large, these people tend to be in favor of mandatory seat belt laws, probably would support the mandatory earthquake insurance law California just passed, are distinctly intolerant when it comes to issues of drug use, etc. Maybe this is just a function of the average age of the U.S. ham population. Does anybody know? Why ARE American hams such rednecks?

I agree 100% with the above!  Since we are going through the process, lets
get the names of the groups to correspond to convention.  Also lets
make the group names descriptive.  Get rid of the "ham" and substitute
amateur!

While I am not sure that rec.radio.amateur.legal is the best name for the
                           ^^^^^
additional group, I do not have a better suggestion so will go along with
this until a better idea comes along.

I heard the Shuttle tonight on it's circa 11:30 pm pass (12/6/90).
Boy! They fooled me! When I first turned on my scanner to 145.51 MHz I
thought I was listening to someone down the street yaking on the
Shuttle frequency! It turned out to be one of the crew members,
not Ron P. but someone else, talking to his family. I was using
my Radio Shack PRO-34 with NO preamp and a 19" whip antenna. Presumably Ron was in control of the transmitter as any good ham would
be. I guess the earth-side of the conversation was in Houston TX area.
This was a ~55 degree max elevation pass.

This is utter nonsense! One groups administrative problems, either
real or perceived, do NOT constitute a logical justification for opposing
real progress which is needed in this case.

This depends on what you want in the subgroup. I believe most everyone wants to see the "no code wars" and the "pizza patch wars" put away in this subgroup. But what about issues like "antenna covenants" and stuff like "urban zoning" as it relates to ham (excuse me, amateur) radio?

Also there are legal issues related to radio but NOT amateur radio, such as the issues related to listening to private transmissions. Maybe we need:

rec.radio.legal

or even:

rec.radio.moral :-) [smiley means I am NOT serious]

This is yet another opportunity to further promote a more modern amateur radio service and shrug off the "ham" concept which is some people's minds is someone "hamming it up" on a radio in a way much like CB.

> I'd also advocate mv'ing the parent group into a .misc group

If this concept works, what was the original problem in the first case?
I really don't see any particular need to do this.

Sounds like an interesting idea. It would certainly "document" the
differences and perhaps reduce a lot of the "is this the CB group"
question postings.

Jay, do we want to include NON-FCC legal issues as well, such as local
zoning and covenant problems?

> From: jpd@pc.usl.edu (Dugal James P.)
> Date: 5 Dec 90 23:00:36 GMT

> I agree; how about calling it "rules" rather than "legal" ?

If we want to limit the group to FCC rules, then ".rules" would work.
DO NOT use ".fcc" since this is a world-wide newsgroup.

Usenet changes newsgroups often (read news.groups) and there should be
in place some administrative or automatic function to keep things up to
date there. Why don't you offer to help do it?

Really now, should the rest of us be bound to limitations which are the
cause of one or a few systems having insufficient system administrator
resources or competency? I say we should not. Sorry, Mike.

> proven to be a remarkable flame generator...

It has my support.  As I mentioned before I believe it could readily show
that there *IS* a difference.  Lots of people still don't know there is a
difference between ham or amateur radio and CB radio.
-----------------------------------------------------------------------------

> to several rec.ham-radio groups, thus increasing the noise level.
> With rec.ham-radio.rules (or rec.radio.amateur.rules) we might
> save some bandwidth (and sanity).

If someone has a legal issue, such as:
     is it legal to...
     is it illegal to...
     we should remove rule...
     we should add rule...
and cross posts it, then the the problem is with someone who is simply
not thinking about what they are doing.  Eliminating ALL these groups
would clearly get rid of that problem.  Of course we don't want to do
that.  The difference between "legal" and "rules" is small, but there
is some.  The NON-rules things would be left out.  Maybe that is what
the consensus wants in which case ".rules" would be appropriate.
-----------------------------------------------------------------------------

Sometimes it comes in floods.  More often in firestorms.  When it does
come, it seems to be causing readers to drop off.

> r.r.a.swap might be better as just rec.radio.swap, since this may encourage
> others with non-amateur-specific yet amateur-related equipment to post

> ham specific.  Traffic on the current r.h-r.swap is relatively light
> the way it is now (probably averages about 8 articles/day), so expanding
> it seems to be logical.
```

That seems like a reasonable argument. While there might be some reason to separate amateur-only swap posting so that they can be fed into a packet network, that might be a BAD THING by encouraging the lack of someone (carbon based unit) filtering the messages. But this is a matter for rec.radio.amateur.legal when it comes online (presumptuous aren't I).

> Another idea, though I don't feel too strongly one way or the other
> on this one. Make it rec.radio.amateur.digital instead of .packet.

> this is their place to hang out. :-)

This is probably where r.r.a.tech or such might be better. Where would you like to classify transmitting voice by digital, but not packet, means?

Phil's corollary:
If I was able to fix it, then it must have been broken.

It's rather good; there's nothing else quite like it. Good chapter on active antennas, especially. It certainly does not duplicate other books.

This is not a flame. Special event stations are neat. It just struck me that I see the phrase "all bands" a lot when only the five traditional HF bands are meant. I think this reflects a mindset in amateur radio that may result in there only being five (or seven) bands left for ham radio some day. Pity.

If any straight but sloped horizontal antenna within a half wavelength or
less of the ground, it will tend to be directional toward the lower end.

>   Superseded by rec.radio.ham.packet
> 3. rec.ham-radio.swap
>   Replaced by rec.radio.ham.swap

The fallacy of this proposal as I see it is that rec.radio.ham.legal will consist of cross-posts to/from the base group. The purpose of many of the posts that prompted this proposed reorganization of the groups is to wake up amateurs to the political implications for the survival of amateur radio of many regulatory matters. These posters will continue to cross-post in an attempt to get the widest readership. In addition, many of the postings that the reorganizers want shifted to legal are triggered by posts in the base group and will continue to be answered in the base group until a flurry of postings begging for the thread to be taken to legal are received in the base group. This is not the intended result of this reorganization.
A better plan (IMHO) is as follows:

1. rec.radio.ham.bland
     A safe smug little hole for those offended by controversy. No posting of mods allowed. No postings about antenna matching allowed. No code/no-code postings allowed. No mention of autopatches allowed. No mention of the future of amateur radio allowed. No postings about VECs allowed. No mention of using amateur radio in aircraft or trains

allowed. Don't even use the letters A R R L in this group. No content allowed.

2. rec.radio.ham.misc
   A general replacement for the current rowdy base group.

3. rec.radio.ham.swap
   The swap group works relatively well, though for sale postings do continue to be seen in the base group.

4. rec.radio.ham.packet
   The packet group works relatively well, though it too seems full of cross-posts lately.

Don't even THINK of renaming the groups "amateur" rather than "ham", that's MUCH too controversial.

I had a somewhat similar experience at a former apartment. Everything was working fine until the landlord decided to replace the water pipe coming into the house. (It was all gunked up on the inside so that if more than one faucet was on at a time the water pressure disappeared.) Anyway, as soon as the contractor cut the old pipe a big spark shot out of it and the AC voltage in the house went UP! I'm not sure how high (I wasn't home), but I'm guessing 220V. Apparently the ground (neutral) at the utility pole wasn't hooked up or something of the sort, so that the only ground was through our water pipe (until it was cut).

Anyway, we lost most of the smoke detectors, light bulbs, a doorbell, and
I think a radio or TV set downstairs. I don't think the utility paid
anything. Fortunately, all my stuff survived; it was off at the time.

-want right out of the box. If you don't really *need* remote touchtone
-control, it's a real win.

Maybe I should mention my experience with my 570T.  It performs flawlessly
in most respects, but it does have one _very_ annoying feature.  If you
want to store a repeater frequency that requires a CTCSS tone, it will
remember the tone just fine, but it won't remember to transmit the tone
when that channel is selected!  You must manually select whether or not
CTCSS tones are to be transmitted, even though the actual tone is
properly stored in memory. UGH!  This means that you must remember which
repeaters need tones and manually switch on/off the CTCSS feature every
time you stop scanning.  Does anyone know how to fix this?  I called
Alinco and they said that that's the way it is, and tough.  Their suggestion
was to get a 590T!  I'm not scared of ripping into the radio to fix it.
Any help anyone can give me will be greatly appreciated!

Let me just say that I'd oppose any proposal to create a
 ".tech" subgroup because most of the existing postings
are technical to some degree or another and most Amateur
Radio operators think that they are technically oriented
so it wouldn't split the traffic neatly -- which is the
point of having a subgroup created...

Concerning solar system stability, it must be conceded that this is not a completely solved problem.

Perturbation theory techniques are the traditional way to evaluate this problem. However, use of them depends on dropping higher-order terms, and there is the problem of how much these contribute to the final results. In particular, if there is a near-commensurability in some of the orbit periods, then that will magnify the effect of whatever terms in which it causes a near-cancellation of the rate of change. Example: if there are two objects, 1 and 2, of which object 1 has a mean angular velocity twice that of object 2, then terms containing expressions like:

l1 - 2*l2

where l1 and l2 are the mean longitudes of the two objects, will change slowly and may even produce big oscillations in l1 and l2.

Since most perturbation-theory analyses ultimately involve averaging over orbit positions, resonance terms like the example mentioned above are a serious difficulty, unless they can be identified.

Even in that case, one may approach the limits of analytical tractability, and have to resort to numerical integration, which can be done directly on the coordinates of the objects. I note that orbit elements can be thought of as "coordinates" in this context, though their equations of motion are more complicated than the equations of motion for positions and velocities.

Direct integration of the positions and velocities also has the advantage of keeping all the terms, as it were, as opposed to doing integration for the orbit elements with a truncated perturbation series, due to the missing-term problem. However, integrating orbit elements can cover a much longer time range for a truncated perturbation series, because the orbit-variation timescale is usually much greater than the orbit periods.

Actual results? It appears that some of the objects in the Solar System move chaotically. Saturn's satellite Hyperion is known to tumble chaotically, for instance. And numerically integrating Pluto's orbit reveals it to change chaotically. There is even evidence for chaos in the motions of the four big planets -- Jupiter, Saturn, Uranus, and Neptune. However, the "size" of the region of chaos is still uncertain. If it turns out to be small, then the motions of the planets are predictable within that region, and it may even be that the Solar System is stable over timescales of billions of years despite the weak chaos in the motions of the planets. More research on this question will certainly be needed.

Hello, all -

Got a call last evening from Hank Hayes, one of the operators of Radio Free New York - a free radio station which broadcasts a 3-hour program each Saturday night at 11pm Eastern via the transmitter facilities of WWCR, 7520 kHz.

This Saturday night is the 10th anniversary of the death of John Lennon and the station is planning a special memorial broadcast. They have some super special things planned for this program, including clips of the first radio and tv announcements of the shooting. They plan to do some live broadcasting from the Dakota Apartments on Central Park West where Lennon lived with his family and plenty of other great stuff. The focus is intended to be upbeat and comprised of fond memories.

Don't miss it. For those of you who participate on Los Numeros, the broadcasting crew will be live on-line with us during their broadcast.

Time and place, once again - WWCR, 7520 kHz, 11pm Eastern, Saturday night local, 12/8 (0400 UTC Sunday 12/9).

        /HM

Will whoever is redistributing this mailing list to Loren Thompson or others via a Gatormail system please stop doing it? Your mailer is breaking with great regularity, and spewing copies of every failed message all over the USENET, annoying thousands of people worldwide.

It's not a very good advertisement for Gatormail either, since it shows that it's not handling RFC822 error-returns very well.

Love and kisses.

I'm afraid that this may be my last posting. Philips is having layoffs, and I might get canned. I liked having access to these newsgroups, and would like to regain access at some other site.

If anyone knows of anyone looking for a person who knows about HDTV, NTSC, video, digital signal processing, high speed digital logic design, have them call me at 201-261-4066. Also, point any and all headhunters my way. I have 11 patents.

The notion of mv'ing rec.ham-radio to rec.radio.* is an excellent one which I fully support.

The new heirarchy should be rec.radio.AMATEUR though not rec.radio.HAM because the jargon term "Ham-Radio" is not common outside North America and large portions of the net are now outside North America (unlike when the current group was created). By using the normal, non-US-jargon terminology the namespace is clearer and easier for folks to use. It is also easier for folks potentially interested in becoming licensed Amateur Radio Operators find the right newsgroup.

I'd also advocate mv'ing the parent group into a .misc group (or equivalent) to reduce cross-posting and make the namespace simpler (hence easier to use). I know that Jay won't like this last idea since he`s opposed the whole .misc concept in news.groups, but I still see lots of hard evidence that the concept works in the general case not just in comp.sys.*

Perhaps you mean the Class C calls are used up? The Class A calls have a way to go yet. California has only reached the high AA6s (well, maybe just starting AB6 by now). We have gone through all the N6xxx, however; the last of the Class Cs.

Yeah, that's not that unusual. The voltage here in my house right now is 125v, and has been pretty much that for the last seven years. And my lightbulbs don't last real long either.

Our mountaintop repeater site had line voltage around 132 volts back in 1971; it's been dropping steadily since and is now down to about 118 - either the lines are aging or it's all the additional load as more equipment gets installed.

At work the voltage is a nice 117.5 on two of the three phases. It's about a volt higher on the third; I think there are fewer VAXes on that phase.

>house. About 6 weeks ago, I was at my parents', and for some reason, I
>measured the powerline. (Now I remember, an old powerline volt monitor
>meter I had in the hamshack room seemed to be reading high. Must be
>broken, get out a good digital meter to check the voltage. Oh, 128V!

>Guy leaves, a few hours later, calls. "try measuring the voltage" "Still too
>high, 127V."

>We like to set the voltage at 120V at houses."

Yeah, but not too high by much...

The typical electric utility tariff (what the utility must provide under its contract with your state government) calls for 120v +/- 5% at your meter, or 114-126 volts. You can't really complain about 126 volts. Also, a 'good' digital (or analog) meter will not necessarily give an accurate reading, as most of them are average-responding, rms-reading, because if there are a lot of solid-state power controls on your feeder, the AC waveform can get fairly chopped up.

I'll make sure the text for the CfV explains the reason behind the relocation.
I'm not married to rec.radio.ham versus rec.radio.ham.misc; comments, folks?
For that matter, there seems to be some sentiment for .amateur versus .ham;
I'd like to see some kind of consensus one way or the other.

>  Finally, I don't personally like the .legal name, as it encourages

The name .legal came from the commonest flame on rec.ham-radio: "You can't do
that, it's illegal!" It describes the intended traffic pretty well.

How does one shunt feed a steel tower? It has to be painted of course, so
```

contact is not easy. One could scrape off the paint if you knew the exact spot needed for the tap, but I suspect that is subject to some experimentation, and you can't scrape the paint off everywhere. I have tried to do this by wrapping heavy aluminum foil around a painted tower leg, to achieve a capacitive coupling. The capacitance is fairly large, so the reactance is not too large. It is also easy to slide it up and down for adjustment. But it never worked anyway. How have others solved this problem?

Very good point. The gamma rods turn out to be real long too with the 160 meter one being 32 feet. The crankup poses some interesting mechanical and electrical problems. Any solution that requires climbing the cranked up tower is too dangerous to think about. Perhaps telescoping gamma rods with finger stock at the join and spring loaded metal rollers at the tower joins would work. They'd probably wind up being RFI generators though.

You are lucky. A friend of mine was the victim of a power company mistake. They rewired his transformer and started feeding him 400V. They paid for his microwave, refridgerator, clocks, and answering machine.

{>only thing you really are after.
{
{Well not quite
{   Most other rigs dont allow the remote controll including QSY that
{the Alinco does.

True, but I believe that there are a few that do and without some of the
mobiling features of the Alinco they SHOULD be cheaper. I haven't looked
though so I can't give models etc.

{Mike then writes:
{> couple of . . . problems . . .: (1) to enable cross-band repeat you must
{>cut a wire that inhibits out of band operation. BOTH TX and RX! THat could
{>be a real problem with remote operation.
{
{This is completely incorrect. When you cut the wire it ENABLES out of band
{operation.

Isn't that what I said? "the wire inhibits out of band operation"

{He then continues:
{>There is no easy way to "one way repeat" i.e. UHF to VHF only.
{
{This is incorrect. If the DTMF squelch is enabled on both 2m es 440 then
{the proper tone sequence is required to open the squelch and you can use
{your ht to RX and your remote base to TX.

Have you tried this? I don't have the DTMF squelch, but the manual (the new one) says that the DTMF squelch works for BOTH bands at the same time. It says nothing about the repeater mode however. I plan to use PL for this purpose.

Since both are $40+ option boards I don't classify either as "easy" however. Setting a control, cutting a wire I class as "easy".

{Furthermore as I posted last month, I have been working with Dexter and Greg
{at Alinco and have found a way to automatically control the offset.

It works, but it would still be nice to have a "readback" to know just what is "in there".

*Mike Waters   AA4MW/7 waters@dover.sps.mot.com *

There is no right way to do wrong.

Origination of traffic going INTO the Persian Gulf is being discouraged
at this time by MARS. They want to be able to get the traffic OUT of there
even more than they are concerned about getting it INTO the area.

This is the information I have as of last week, per discussions with the
rest of the people in my local NTS net.

The most current orbital elements from the NASA Prediction Bulletins are
carried on the Celestial BBS, (513) 427-0674, and are updated several times
weekly. Documentation and tracking software are also available on this
system. As a service to the satellite user community, the most current
elements for the current shuttle mission are provided below. The Celestial
BBS may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data
bits, 1 stop bit, no parity.

>Mike KC1RP

Sorry to disappoint you Mike, but the 'dumb mode' you speak of is
actually 'KISS' (for Keep It Simple Stupid) protocol. This is a very
precise and extensive protocol all of it's own. There was someone on the
net that put a complete description of the KISS protocol, either here or
on rec.ham.packet - I'm not sure which. The problem is that the port on
your computer is async, with start and stop bits, and the signal on the
analog side of the modem is synchronous NRZI SDLC. Plus the function of

going push-to-talk and deciding when to transmit (Clear channel) I
beleive is all done in the TNC. So although it's supposed to be Simple
it really is not 'dumb' I guess. In other words you need a TNC or some
kind of KISS protocol emulator.

I also like the re-structure, but find it might offer more clarity to go
with rec.radio.amateur , etc.; in either case, I support the move to conform
to net standard/convention...

In article <1246@west.West.Sun.COM> flloyd@L1-A.West.Sun.COM (Fred Lloyd SUN Phoenix SE 602-275-4242) writes:
{
{He said that almost all of the basic codes were in the manual but that
{the were very lightly covered. One pair of codes that were not
{mentioned were D99 (cross band repeat ON) and D01 (cross band repeat OFF).

{Contrary to what others have said on this forum, I saw him change
{frequencies on both bands from the remote radio. He was going in on 2m
{and out on 440. He was able to set the 440 frequency as well as the 2
{meter frequency by remote control. He indicated that only PL and
{repeater offset could not be set remotely, however he did acknowledge
{the trick of putting a shift in one of the ARM memories which he
{learned from a user. He said that even the engineers in Japan were
{unaware of this.

Sounds like "hacking" of the three digit codes from A00 through D99 might just be worthwhile here! THe ones I posted were the only ones in the new (printed) manual. If indeed you can do any of the functions that you can remote from the mic. then indeed it IS a powerful feature.

As for offsets and PL tones, personally I like to put the whole lot in a memory and just select it that way. I only use a couple of repeaters with PL tones anyway!

{I asked him about documentation and he said that they were faxing it
{out to all the stores which carry it. Apparently one can call them
{as well (FAX: (213) 618-8758 or Voice: (213) 618-8616).

I will give them a call an ask! Thanks!

{The comment was made that when the Japaneese brought the radio out to
{the U.S., they only mentioned in passing that the rig could be
{controlled remotely. Apparently, they never thought much about it
{themselves. They (the Japaneese) were surprised at how much commotion
{their American sales reps made about it.
{
{This leads me to speculate that what has happened here is that remote
{control of the radio was developed by "accident" as an outgrowth of the
{ability to control the rig from its microphone touch tone pad. It
{seems that when the dsq (dtmf decoder) was added that these features
{suddenly became available. This would explain why the radio has been
{called an "almost great" in that the remote-base functions are "nearly
{complete". Perhaps it was never designed to begin with.
{
{I would further speculate that much will be learned by both Alinco and
{its competitors from this radio and that by next year a "complete" or
{fully functional remotable rig will be available.

Certainly makes as much sense as any other explanation that I have heard.
For the most part, the rest of the rig is SO well done that it really is
jarring to see something like this that is simply not done.

It is clear that the translated manual is at least part of the problem and
that they must have had trouble getting a good translation. THe manual I
got with my rig was Xeroxed and had all kinds of stuff on odd pages - as if
someone was still doing a "paste up". THey sent me a printed one free and
it is MUCH better, but it looks like there are still a few things missing
in it.

{I can't wait :-)

Me either!

{-fred (still stuck with my 721), AA7BQ

Sounds good to me on 2M at least :-) Mine is down right now because of an
alternator problem in the car, but hopefully I'll see you on 2 again.

>   Replaced by rec.radio.ham.swap
>

This makes sense... BUT if we are going to go through the pain of changing the name of this group, we SHOULD make an effort to refer to ourselves in a way that a casual 'reader' (the supposed 'lay' reader, or non-amateur) would understand who we are.....

Basically, what I am saying is that all references to the slang 'HAM' should be changed to 'AMATEUR'.... therefore 'rec.radio.ham' becomes 'rec.radio.amateur' and so on.   This will not cause confusion on anyones part. I think that only 'hams' know what the term 'ham' radio really means.

PLEASE, if we are going to change names of the group, lets go for the full name:

```
    rec.radio.amateur
    rec.radio.amateur.packet
    rec.radio.amateur.swap
    rec.radio.amateur.legal    (yes, I think this subgroup can be added,
                                although I wonder how many people will 'read'
                                it at all!)
```

P.S. It seems that this site only receives a VERY FEW postings for rec.ham-radio. So if I seem to not know what is going on... it's because I don't!!!

Rich

I completely agree with this proposal to change the proposed name to
...rules.  I have been very uneasy about the ...legal name, believing that
it would *not* be intuitively obvious what *should* be in the new
group.  I felt the result would be that people would cross-post
to several rec.ham-radio groups, thus increasing the noise level.
With rec.ham-radio.rules (or rec.radio.amateur.rules) we might
save some bandwidth (and sanity).

I'm interested in hearing from HW8 owners and ex-owners. I'm interested in

performance mods

like replacing diodes & transistors to soup it up (such
as the HR article for the HW-7)

improving the front end on higher bands?

others?

functional mods

rit perhaps?

misc

Anybody warc'd theirs?

Have a favorite traveling antenna for yours?

73s,

Mike Harris - KM4UL   harrismd@dg-rtp.dg.com

In article <19@shasta.Stanford.EDU> paulf@shasta.Stanford.EDU (paulf) writes:
> Jay Maynard and I propose the following reorganization of the rec.ham-radio
> hierarchy:

I would respectfully suggest the slang term "ham" be replaced by the
proper designation "amateur".  This slang term has caused more
problems for public relations and promotion of amateur radio around
the world than any other single thing (IMHO).

I propose the proposal be re-worded as follows (uppercase used for
emphasis):

  1. rec.radio.AMATEUR

     "A General newsgroup for discussions about amateur radio."
                               ^^^^^^^
  2. rec.radio.AMATEUR.legal

     "A newsgroup for the discussion of legal aspects of amateur radio."
                                     ^^^^^^^
  3. rec.radio.AMATEUR.packet

     "A newsgroup for discussions about amateur packet radio."
                          ^^^^^^^
  4. rec.radio.AMATEUR.swap

     "A forsale group for the rec.radio.amateur hierarchy."

FILED NOV 13 PM 4:39
CLERK U.S. DISTRICT COURT
NORTHERN OHIO DISTRICT
CLEVELAND

UNITED STATES DISTRICT COURT
NORTHERN DISTRICT OF OHIO
EASTERN DIVISION

JAMES D. MACMILLAN,) 1:87 CV 2820
)
Plaintiff,)
)
vs -) ORDER
)
CITY OF ROCKY RIVER, et al.,) -----
)
Defendants.)

Battisti, J.

On September 21, 1990, an order was issued addressing the parties cross motions for summary judgment in the instant case. The court ruled that the Rocky River municipal ordinances in question were facially valid, but as applied were preempted by PRB-1, an FCC regulation. In so ruling, the court declined to reach the constitutional issues raised by the Plaintiff, James D. MacMillan. Plaintiff was left to seek his amateur radio antenna permit under the codified Rocky River procedures, and Defendants were instructed that future decision making in this area must include "a reasonable accommodation of the federal government's interest in amateur communications," as expressed in PRB-1.

With the issue of the ordinances' validity addressed, all that remained for consideration was the plaintiff's request for damages. Accordingly, the parties were requested to brief

any remaining claims for damages. (1)

Since Plaintiff's subsequent brief raised only the issue of attorneys fees under 42 U.S.C. sec. 1988, the court assumes that this is the only issue remaining for disposition.

Section 1988 states, in pertinent part:

> In any section or proceeding to enforce a provision of sections 1981, 1982, 1983, 1985, and 1986 of this title, title IX of Public Law 92-318, or title VI of the Civil Rights Act of 1964, the court, in its discretion, may allow the prevailing party, other than the United States, a reasonable attorney's fee as part of the costs.

The Plaintiff claims that although the court did not rule on any of his constitutional claims, he is entitled to attorney's fees as discussed in Maher V. Gagne, 448 U.S. 122, 130-32 (1980).

Although Maher explores the intended scope of sec. 1988, Seaway Drive-In, Inc. v. Township of Clay, 791 F.2d 447 (6th Cir.1986), cert. denied 479 U.S. 884 (1987), is more relevant to the present inquiry. Seaway Drive-In explains the Sixth Circuit's application of Maher, as well as, the Supreme Court's later holdings in Smith v. Robinson, 468 U.S. 992 (1984), and Hensley v. Eckerhart, 461 U.S. 424 (1983).

In Seaway Drive-In, the Plaintiff challenged a town ordinance that regulated drive-ins. 791 F.2d at 449. A preliminary injunction and eventual consent decree were based upon state law claims, obviating the need for the district court to consider the plaintiff's constitutional challenges Id. The district court declined to award the sec. 1988 attorney's fees and the court of appeals reversed. Id. at 455. Seaway Drive-In is analogous to the instant case in which the court did not reach the Plaintiff's constitutional challenges due to the presence of a dispositive non-fee claim.

The Seaway Drive-In court began its analysis by citing the following passage from Maher.

> The legislative history [of sec. 1988] makes it clear that Congress intended fees to be awarded where a pendant constitutional claim is involved, even if the statutory claim on which the plaintiff prevailed is one for which fees cannot be awarded under the act. The report of the Committee on the Judiciary of the House of Representatives accompanying H.R. 15460, a bill substantially identical to the Senate bill that was finally enacted, stated:
>
>> To the extent a plaintiff joins a claim under one of the statutes enumerated in H.R. 15460 with a claim that does not allow attorney fees, that plaintiff, if it prevails on the non-fee claim, is entitled to a determination on the

---

(1) The court has held that the Defendants were entitled to qualified immunity with regard to the claims against them in their individual capacity.

> other claim for the purpose of awarding fees.
>
> Morales v. Haines,486 F.2d 880 (7th Cir. 1973). In some instances, however,the claim with fees may involve a constitutional question which the courts are reluctant to resolve if the non-constitutional claim is dispositive.
>
> Hagens v. Lavine, 415 U.S. 528 [94 S.Ct. 1372, 39 L.Ed.2d] (1974). In such cases, if the claim for which fees may be awarded meets the 'substantiality' test, see Hagans v. Lavine, supra; United Mine Workers v Gibbs, 383 U.S. 715 [86 S.Ct. 1130, 16 L.Ed.2d 218] (1966), attorney's fees may be allowed even though the court declines to enter judgment for the plaintiff on that claim, so long as the plaintiff prevails on the non-fee claim arising out of a 'common nucleus of operative fact.' United Mine Workers v. Gibbs, supra, at 725 [86 S.Ct. at 1138]. H.R.Rep. No. 94-1558, p. 4, n. 7 (1976).

448 U.S. at 132, n. 15 (cited at 791 F.2d at 451). The court equated the test laid out in the legislative history -- i.e. the requirements that the fee claim be substantial and that the fee and non-fee claims arise out of a common nucleus of operative -- with that used to determine whether a court has pendent jurisdiction over state law claims. Seaway Drive-In, 791 F.2d at 452. In addition, it held that the district court had erred in basing its substantiality determination on whether the fee claims could survive a motion for summary judgment at the time of the consent decree. Id. Under the proper substantiality test, a claim is only "insubstantial if it is `obviously without merit' or if `its unsoundness so clearly results from the previous decisions of [the Supreme Court] as to foreclose the subject and leave no room for the inference that the question sought to be raised can be the subject of controversy, '" Id. (Citing Hagans, 415 U.S. at 537).(2)

Based upon the sixth Circuit's construction of the Maher test, this court finds that Plaintiff's constitutional claims were both substantial and arising out of a nucleus of jurisdiction of the District Court, whatever may be the ultimate resolution of the federal issues on the merits.' " Seaway Drive-In, Inc. v. Township of Clay, 791 F.2d 447, 452 (6th Cir. 1986), cert. denied 479 U.S. 884 (1987), (citing Hagans v. Lavine, 415 U.S. 528, 543 (1974)).

---

(2) Further the court stated that " [t]he claim must be `so insubstantial, implausible, foreclosed by prior decisions of [the Supreme Court] or otherwise completely devoid of merit as not to involve a federal controversy within the

operative fact common to both the fee and non-fee claims.(3)

Finally, the Defendants make the unfounded claim that the plaintiff is not a prevailing party. The plaintiff is considered to have prevailed if there is "some actual benefit to the plaintiff either in terms of monetary damages, injunctive relief or a voluntary change in defendant's conduct. " Wooldridge v Marlene Industries Corp., 898 F.2d 1169, 1174 (6th Cir. 1990).

Plaintiff's claims all involved a challenge to the review process to which he was subjected. The court determined that the process was flawed, but only reached

---

(3) The Defendants raise Smith v. Robinson, 468 U.S. 992 (1984), as a basis for denying attorney's fees. The Sixth Circuit addressed both Smith and Hensley v. Eckerhart, 461 U.S. 424 (1983), in Seaway Drive-In, Inc. v. Township of Clay, 791 F.2d 447, 453-55 (6th Cir. 1986), cert. denied 479 U.S. 884 (1987).

Smith involved plaintiff seeking district court review of an adverse agency ruling on numerous non-fee grounds. The only fee claim was a due process attack on the administrative proceedings themselves. The due process claim sought only to prevent further state hearings under the challenged regulation. The Court's holding, therefore, that a fee award was inappropriate was based on the fact that "the due process claim and the substantive claim on which plaintiffs ultimately prevailed involved entirely separate legal theories and, more important, would have warranted entirely different relief. " Smith, 468 U.S. at 1015.

The Sixth circuit viewed Hensley as reaching a similar holding. "Hensley makes clear that the purpose of the 'relationship between the claims' element or the fees award test is to prevent the award of fees in those cases where the fees and non-fee claims ar aimed at achieving different results or where they are based on different facts and different legal theories." Seaway Drive-In, 791 F.2d at 455.

Neither of these cases is analogous to the instant case. The constitutional claims in this case arose from the same local review process. In addition, the relief available in each was substantially similar.

Plaintiff'spreemption claim. plaintiff has, therefore, succeeded in obtaining a new hearing in which the federal interest in amateur radio operation is to be seriously considered. This should lead to a hearing process which is substantially different from plaintiff's last hearing.

Defendants make the alarming allegation that the new review "is consistent with and is not a material alteration of previous consideration of PRB-l by ROCKY RIVER. " This statement is followed by a Citations to the transcript of the prior review which indicates that PRB-l and technical data were submitted for consideration. The Defendants ought not to think that they will comply with this court's order by merely going through the motions or denying Mr. MacMillan another permit. Any decision to disregard the federal interest raised in PRB-l must be based upon substantial justification end explained in the record. Defendants should keep in mind that after this litigation it may be more difficult to support a claim for qualified immunity if they once again fail to sufficiently consider the federal interests involved.

Plaintiff's motion for sec. 1988 attorney's fees is GRANTED. Plaintiff is instructed to submit a reasonable accounting of his fees in this case within thirty days of the issuance of this order.

IT IS SO ORDERED.

Frank J. Battisti.
United States District Judge

As someone who is just beginning to study the appropriate rules and code (in contemplation of a Novice license), I wonder if anyone has an idea what's the current status of the FCC's Communicator License proposal. Is it still in the review stage? And if it's already been approved, when does it take effect?

Thanks in advance for your reply.

>Mike.

Ignoring the fact that local administrative problems aren't of relevance to the net at large, there probably are a fair number of folks who'd like to read the Amateur Radio groups as mail rather than news.

Perhaps someone out there would be willing to setup a news->mail gateway for one or more of these groups. There is a very slight chance I could work out something like that, but it isn't trivial for me in my present circumstance. Surely there is an Amateur Radio operator who is a sysadmin

somewhere already who could be talked into creating such a service. I'd
be happy to help out with the "How to set it up under UNIX ?" if someone
were willing to put it in place.

>a beer.

Seen in Usenet newsgroup sci.space.celmech.history, 6 Dec 2000001990:

The adjudicating committee appointed last year has regretfully
announced that the Two Billion Year Bet has had to be called off.
The pizza was good, but everyone had to buy their own beers.
(The management did, however, agree to a special rate, only
$6945/liter for an excellent import from Heidelberg IV. The
local branches of the major US brewers offered to provide beer
free, but everyone naturally ignored them.) Citing impossible
difficulties in deciding whether the solar system would have
been stable if left alone, the committee concluded that no
settlement of the bet was possible. "Moving Venus and Mercury

out was not that big a deal, and we think we could have allowed
for that, but the Arts Council grant of 3476876 for rearranging
the asteroids into aesthetically pleasing formations by modulating
the orbit of Jupiter just caused hopeless confusion, and when the
Flat Ecliptic Society started tidying the orbits up in preparation
for the Galactic Fair of 78654379, well, that was the last straw.
Not even the generous donation of five milliseconds of Cray-94673
time by UUNET Intergalactic Communications Inc was sufficient to
decide what would have happened if the upkeep of the solar system
had been neglected for so long."

We experience end-to-end delays of up to 250 milliseconds in full-duplex OSCAR
13 SSB, and it's quite tolerable. While most contacts are still conducted
half-duplex style, many ops casually converse in full-duplex very successfully.
Not that the lack of delay wouldn't be desirable, but for the record, a big
delay is being tolerated today.

By the way, on the subject of delayed full-duplex, pileups on OSCAR 13 are
unique, since everyone can hear how well they are heard in the downlink. We
can get into a mode where everyone collides, then there's a bit of a lull, so
everyone tries again. Retrying after a random time is often more successful.
Sort of like a real ETHERnet.

>
> Finally, I don't personally like the .legal name, as it encourages thought of "what part is not legal?" If you can can think of a beter name (ie. more descriptive) it might aid in identifying the group. I don't really care for legal-issues or legalities, but perhaps regulations would be better, since you will probably be talking mostly about things which are not laws (passed by congress) but regulations from the FCC.

How about rec.radio.amateur.policy?

My only objection to the new newsgroup is that it has all the earmarks of sticking one's head in the sand rather than coming to grips with the fact that when ham radio dies (and it probably will) it will be for political reasons. We ignore that side of the hobby at our peril.

The technoids go on and on wonderfully about their ideas for the design of the Phantasmagorical Data Engine with the blind faith assumption that when they're done, we'll have amateur bands to use it in. I don't think we can assume that, and sticking those who write about it in a "newsghetto" so they can be ignored more easily will be counterproductive in the long run. Penny wise and pound foolish, as it were.

We don't "subscribe" to this newsgroup; is it archived somewhere on the
Internet and available for anonymous FTP?

Sounds like a good idea to me. We could use more members, and I think
"amateur" is more recognizable to non-hams.

>   rec.radio.amateur
>   rec.radio.amateur.packet
>   rec.radio.amateur.swap
>   rec.radio.amateur.legal   (yes, I think this subgroup can be added,

> although I wonder how many people will 'read'
> it at all!)

r.r.a.legal seems a bit too specific. Legal debates (e.g. regulation debates, tower ordinances, etc.) seem to come and go in spurts. I don't see the use of having a seperate group for just this particular aspect of normal traffic.

r.r.a.swap might be better as just rec.radio.swap, since this may encourage others with non-amateur-specific yet amateur-related equipment to post here as well. For example, test equipment, SW receivers, scanners, microwave equipment, etc. is of interest to hams, but is not necessarily ham specific. Traffic on the current r.h-r.swap is relatively light the way it is now (probably averages about 8 articles/day), so expanding it seems to be logical.

Another idea, though I don't feel too strongly one way or the other on this one. Make it rec.radio.amateur.digital instead of .packet. This may encourage discussion of possible new modes other than what we commonly consider "packet" (e.g. spread-spectrum). Oops. I can see it now. Some of the die-hard CW ops will decide that this is their place to hang out. :-)

I would like to know if anyone has used one of the commercially available FAX machines over an amateur radio link? I think the signals represent bitmap images (0 bit for a white pixel, 1 bit for a black pixel) sent as a bit stream at a 9600 baud data rate.

If this has been done, how did you do it? How did you interface the FAX to the radio? I presume that the UHF bands were used owing to the bandwith needed.

Any information would be appreciated. I'll summarize and repost if enough interst exists.

This is clearly illegal, and has been for years. If you have a reverse autopatch, you must employ means to ensure that only properly-licensed hams can access it.

I would look first for some equipment/appliance that includes 1 or
more semiconductor rectifying junctions. Garage door openers are
notorious because they have long wires attached which make great
antennas. Also electronic doorbells for the same reason. One
situation I read about involved a kid's crystal radio.

```

Very nice job. Congratulations.

>Transmitting antenna was a 30-foot high top-loaded vertical mounted on
>a 2.5-acre aluminum foil ground plane (part of the permenent
>radiotelescope on the site), fed through approximately 600-feet of
>RG8/U.

You had a very nice signal in NNJ. It's amazing what you can do with such a short antenna. How do you match that thing? The feed point impedance must be very low.

>. We know that we were beaten this
>year by K2WI, who posted 902 QSOs and around 94 multiplier.
>
>Are there any other scores out there? If so, we'd like to hear about
>them!

I heard from W2GD that AB4RU, who was also multi-op, had a higher score than K2WI. They were using a 1/4 wave tower with radials elevated about 30' off ground.

Best score heard was K1ZM, with 1010 QSOs and around 100 multipliers. He was single-op.

Conditions here were fair Friday and poor Saturday. There didn't seem to be much dx activity this year. I ended up with 710 QSOs and 83 mults using a 100' long dipole fed with 600 ohm open wire. It seems to get out ok, but I missed a lot of weak ones that I couldn't hear through the QRN well enough to work.

Ed WA2SRQ

There was a small mis-understanding. I read the origanal article
in comp.sys.atari.8bit which isn't very active and when I posted
my request for a count, it not only went to the atari newsgroup, but
all the others mentioned in the heading. So I really didn't want
all your mail, just the people from comp.sys.atari.8bit. :-)
My mistake....

Someone asked about the memory control of Alinco rigs (with ref to remote control), and while I can't vouch for the 590, I have the DJ-160 HT. On that rig, the memory can be accessed by the rotary dial on top of the HT, and a pushbutton on the top of the front side. Both of those methods are just a increment-decrement. There is NO provision for accessing a memory channel directly.

All in all, I've been very happy with the rig, my first foray into the world of 2m. The only bad things I have to say about it are

1) The manual STINKS to high heaven. It's obviously a translation from Japanese, and it's more confusing than it is useful. It took me 3 weeks to figure out the DTMF/CTCSS functions.

2) Alinco has a good radio, but there are NO accessories available for the HT's. . . They shipped the rigs to get them on the market, but haven't supported them. A speaker/mike would be nice, as would DC adapters, etc...

Well, I've taken up enough bandwidth for today.
Just as a closing comment, does anyone have MARS/CAP mods for the DJ-160? I would be very interested in them.

Yours,

R. Todd Perry

I agree with the other postings: this IS a very nice keyer. I was wondering if the authors have any plans to make the source code available. I notice that the 68HC705C8 has a serial port and built in async communication capability. A keyboard interface would make a nice enhancement to the project.

In fact, since the software recognizes CW from the paddles, a CW reader with terminal interface may not be very hard to do. I read in the latest issue of Monitoring Times that one comercial stand-alone CW reader uses this same processor.

Some of us here at ISC are looking into developing a new interface for the famous KA9Q program under Unix. While KA9Q works under Unix, it is a monolithic program handling all client and server tasks. We would like to split this apart such that clients and servers need not run as the same process.

To do this, we envision something like:

```
         Clients....Clients...Clients....
                \------|--------/-----\
                 Networking Layer------Scheduling Layer
                       |                   |
                      O/S Specific Interface Layer
```

The above approach would allow to develop clients and servers to use a specific set of networking and OS call and not worry about whether we're running AX.25, TCP/IP, SNA/LU6.2 et al. on Unix, DOS, WIN 3, AmigaDos et al.

First question:

What should a multi-processing interface library allow access to?

Process creation, destruction, task prioritizing etc...

What should a networking layer handle?

Set up, Teardown, vc byte streams, datagrams et al.

Comments as always, are welcome...

John Antypas / Interactive Systems Corp. .!uunet!ism!johnan johnan@ism.isc.com

I have spotted several Chicago Police and Illinois State Police
cars with four equal spaced antenna on the roof. The antenna are about 16 inches
long. I believe that this is direction finder equipment for Lojack devices.

I've had some experience shunt feeding towers on 160m. Crank up
towers are particulary difficult to shunt feed. Unless you are
willing to leave your tower fully extended most of the time I
wouldn't recommend shunt feeding it. It's hard to get reliably
good connections between the sections with crank ups. You
might think about guying the thing at the top with phillistran
non-conductive guys and leaving the tower permanently extended.
Then you can bond the tower sections together and mount your
shunt feed connections.

I worked half a dozen Maine stations last weekend in the 160m contest. Some of them had decent signals which I would think you could have heard. I worked 710 stations using an 80 meter dipole, so you don't have to have a 1/4 wave vertical to get out.

Look for KA1PE almost every evening between 1830 and 1840. He's usually chasing DX, but I'm sure he'd gladly give you a contact for WAS. He has a VERY loud signal, and you should have no trouble hearing him.

If someone wants to use amateur frequencies for criminal purposes all they have to do is go down to a Radio Shack store and buy a radio. I would think that anyone sending e-mail to a ham on the .ampr.org domain would be the same as my girlfriend making a reverse autopatch on the local repeater. If I was not there to answer the call, and a control opr was not on freq at the time, SHE would have controlled the repeater. And this DOES happen in the REAL WORLD!! Are we to then say that ALL reverse autopatches are to be turned off ????

I know of a local repeater system that has a special dedicated twisted pair to the local PD so the PD can come up on the HAM repeater whithout ham intervention. They have a 911 service on the machine and if the PD needs additional info, they pick up the handset and PRESTO they are on the air. this has proved to be very helpful in emergency situations.

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

There is one shuttle mission in progress, STS-35, Columbia on the Astro-1/Sarex mission. These orbital elements I copied from WA3NAN last night (a hearty "thank you" to the folks at Goddard Amateur Radio Club for a job well done, as always, in rebroadcasting the shuttle audio and related info) and are element set JSC-13. Note that the check sums at the end of the second and third lines (actually the last digit in both lines) are inaccurate (I didn't bother to calculate them).

I like this proposal -- it matches the naming conventions a bit
better, and (my favorite point) separates the recreational and legal
discussions (I read both, but would prefer not at the same time).

A previous poster suggested using "amateur" rather than "ham", as
it is less colloquial (hows that for the obligatory $10 word?)
-- I agree.

SB RTTYDX @ ALLBBS $RTDX1130
RTTY DX Notes 1of3 11/30/90

RTTY DX Notes for week ending 30th November 1990
BID: $RTDX1130
Part 1 of 3.

Sorry to say this week has been one of those weeks that started out to be very good with all the DX, but as the week progressed, the DX degraded, and by the end of the week we found it hard to talk to the chap next door. Such is life, you can't win all the time. Oh, one good thing of note is: Happy birthday Jules.

Our thanks this week go to I5FLN and the DX packet cluster, JA1BLV, N2HOS, OD5NG, TG9VT, WB8RJX, VE3XJ, VK2EG, W2JGR and the Tri-State DX Packet Cluster Network. Thank you all for your notes and kind thoughts.

SB RTTYDX @ ALLBBS $RTDX1130B
RTTY DX Notes 3of3 11/30/90

RTTY DX Notes for week ending 30th November 1990
BID: $RTDX1130B
Part 3 of 3.

Notes of Interest:

At the time of preparing these notes, nothing has been heard of the ZS9Z/ZS1 (Penguin Island) RTTY operation.

P29BT states that he will be in P29 for two years.

Kampuchea (Cambodia). The XU1DK operation by JG1RVN is on track for 3rd December. All papers and permissions are in hand. QSL to Liason Office of Coalition Government of Democratic Kampuchea, Box 80, Kotimachi, Tokyo, 102-91. Japan. He will transmit on 088 on all bands and will be listening up.

Kure Island KH7 should be activated by KD7P/NH7 from 12th to 21st December. QSL to Box 8265, MOU3, Guam Dededo, GU 96912-8265 USA.

3W3RR is still hoping for early December for the Spratley operation, but reports that he is still short of cards for his previous operation. Do not panic as he confirms that he will QSL all contacts as soon as he gets more cards from INDEXA.

King George Island. It was reported that SP3FVM was in Spain on 7th November, but a further report indicates that he was heard under a dogpile signing HF0POL on 26th November. His last indicated ETA was January. Who knows whats going on there?

UL7PCZ Alex,(RL8PYL) has reported that he is preparing for a trip to Northern Korea and Afghanistan in 1991. Keep your fingers crossed. Alex reports that the latter part of the trip will be the most dangerous. He would like some financial assistance as well.

GL DE DX1.

Hogwash. The FCC tends to abide more by "Good Amateur Practice" than anything else, and it is the populus that decides exactly what is "Good Amateur Practice". The ARRL has always espoused similarly paranoid paternalism when dealing with autopatches, despite the enormous changes in the telecommunications industry during the last decade. The net result has been informal FCC policy which is more restrictive than the written law.

Those who refuse to forsake life in the defense of liberty deserve neither.
Or something like that.

I've had a little adventure with the powerline voltage at my parent's house. About 6 weeks ago, I was at my parents', and for some reason, I measured the powerline. (Now I remember, an old powerline volt monitor meter I had in the hamshack room seemed to be reading high. Must be broken, get out a good digital meter to check the voltage. Oh, 128V! That meter is not broken. tried another digital meter, got the same thing.) Told my father, who is also a ham.
Called the power company (your standard generic "Public Service Electric and Gas"). "No don't want to talk to billing Dept. Ah, guess I want the line to "downed wires, and other such". Talking to phone answering person: "I think my power voltage is too high." "What's too high?" "The voltage, it's a few volts too high" "Duh, well, we'll send some guys out to check out the, ah, what did you call it?" "the voltage in my house".

About a week later, a power company person with a Fluke multimeter visits, and takes the circuit breaker panel off and measures the lines. "yes, you're right, it is too high. What kind of meter did you use? That's just like the ones we use. Must be some bad capacitors on our distribution net. Have to check out the substation." Somehow, the guy broke one of the circuit breakers in the panel. Company says that they'll pay for a replacement.
Guy leaves, a few hours later, calls. "try measuring the voltage" "Still too high, 127V." "Found some bad caps, must be more bad ones. This is gonna take us a while to get this figured out"
About 4 weeks later, two guys from the power company pay a visit. They go to their kilowatt-hour meter in the basement. "We are gonna take the cover off the meter box and measure the voltage from the street. gotta break this old porcelain seal". So, they break their power security seal, the one they use to keep you from cheating on the electric bill. They measure the voltage, 128V. "We're gonna try a house across the street". Did that, same reading. "gonna check the stuff on the distribution net some more, looks like a tough one to fix." "Don't you have to replace your seal?" "Naw. We'll be back in a few days to take another measurement, takes too long to seal it just to remove it again. we trust that you're not gonna steal power". Next day, one of them returns, takes another measurement, still too high. "I'm gonna have your local pole transformer re-tapped to reduce your line. I removed some caps off the net, but I can't take too many off, or else the other end of town will have too low voltage. We like to set the voltage at 120V at houses." He puts a new seal on the meter in the basement. My father said that he haden't seen the insides of the meter box since 40 years ago, when the house was built.

Guess I made the power company guys spend a few weeks work on this.
It's not over, yet. About a year ago, I smelled gas next to a mailbox on the streetcorner. Told the gas company, and saw them drilling holes in the ground throughout the neighborhood for weeks looking for the leak.

I suppose all the neighbors are wondering why their light bulbs don't seem to last as long as they used to. :-

SPECIAL BULLETIN 17 ARLX017
FROM ARRL HEADQUARTERS
NEWINGTON CT DECEMBER 2, 1990
TO ALL RADIO AMATEURS

THE JOHNSON SPACE FLIGHT CENTER AMATEUR RADIO CLUB HAS RELEASED THE FOLLOWING PRELIMINARY KEPLERIAN ELEMENT SET FOR STS-35/SAREX. THE ELEMENT SET EPOCH TIME AND RAAN HAVE BEEN MODIFIED BY N5BF FOR THE SUCCESSFUL COLUMBIA LIFT-OFF TIME 0649 UTC ON DECEMBER 2. SINCE

LIFT-OFF WAS 21 MINUTES AFTER THE SCHEDULED TIME, MOST EVENTS DURING THE MISSION WILL PROBABLY OCCUR 21 MINUTES LATE.

```
SATELLITE, STS-35
  CATALOG NUMBER, TBD
  EPOCH TIME,      90336.3361111
  ELEMENT SET,     JSC-0006-A
  INCLINATION,       28.4690 DEG
  RA OF NODE,         4.5587 DEG
  ECCENTRICITY,    0.0005720
  ARG OF PERIGEE,   246.6067 DEG
  MEAN ANOMALY,     119.6564 DEG
  MEAN MOTION,   15.71792660 REV/DAY
  DECAY RATE,       3.10E-04 REV/DAY SQ
  EPOCH REV,               1
```

MONITOR NASA AFFILIATED RADIO CLUBS WA3NAN, W5RRR, AND W6VIO, AS WELL AS W1AW, FOR UPDATED STS-35 ELEMENT SETS.

THANKS TO W5RRR FOR THE KEPLERIAN DATA.

How about this for a "ham hell": put Herbie and Co. in large, steel-frame
apartment building, where every other resident has TV sets with indoor
antennas. Restrict them to 160 meters QRP only. And put them in a 10X10
room on the second floor. Of course, no antennas are allowed outdoors.
Oh yes, and every apartment has a dimmer switch.

Brad, and for any one else out there who would like to know.
You may call the FCC at their information line :(717)337-1212
nd ask them for the most recently issued callisgns for your call call district
for each of the 4 classes (Novice is class D) well, except for the 4 and 6
districts which only have 3 classes remaining (all the class A calls used up);
Boy my editing stinks.

Because they're young and haven't yet learned that no matter what you do
to the net, disorder increases. There is no way to reverse entropy.

But let them try. It won't hurt for long. Won't help either.

h yes, I forgot to mention. The FCC only tabulates the data on the first of every
month. Usually they have the info available around the 5th of the month.
Remember, they process applications (or at least release them) on a weekly or
semi-weekly basis (depending on class of liscence) and each of those batches
are assigned callsigns in alphabetical order by last name. So guestimation
example: KJ2AAA at the end of October - KJ2ADZ at the end of November. Now
November 1990 had (your a Novice, right?) four TUESDAYS in it. So we will
assume (big assume) that the calls were assigned in four equal batches of 26.
Lets pretend that your test date was around October 15, meaning 5 weeks later
(figuring it takes about 6 weeks to get a liscence around x-mas, though any
number from 2 to 7 weeks is feasable for our 'FCC process date guess')
This says that Brian's 610 was processed by our example FCC on Nov 20
(just in time for the FCC employees to go home for Thanksgiving!)
putting him in the KJ2ACA-KJ2ACZ group. Brians last name is Andersen so we

could guess that he will be first or second (or even third) yielding a call
of KJ2ACA,B, or C. Of course much of this is VERY guess related and being
honest with the net here, I have had little luck forcasting Novice callisgns
(especially since many Novices are tested outside of the VE system)
now advanced calls I can get within 2 or 3 letters (well 75% of the time - 9/
out of 12) The extras have the problem of hams waiting around for "the call"
to sail along and then sending a 610 direct to Gettysburg (3-4 wekk turnaround)
for just a callsign change. Then there are all the different VEC (mostly areas
outside of my neck of the woods 1 and 2-land) which have all sorts of different
timing schemes that I have little knowledge of....
If anybody would like more info, e-mail me and I'll send you some more detailed
info on timeing your callsign. But then again, I'm sticking with the call they
gave me before I had a choice!

Ignorance. Count the number of exclamation points at the end of the
poster's sentence you quoted. Anyone who puts more than one
exclamation point at the end of a sentence isn't worth bothering
about.

-- MAJOR SOLAR FLARE ALERT --

DECEMBER 04, 1990

Potential Impact Forecast
Flare Event Summary

MAJOR ENERGETIC EVENT SUMMARY

Region 6397 (N09E45) has been throwing some unexpected surprises at us lately. It has been abnormally active considering the relatively weak magnetic gradients which have been observed in the region. At 02:03 UT on 04 December, Region 6397 spawned an M6.6/1F major flare at a solar position of N08E56. This event was accompanied by a 310 s.f.u. Tenflare. There were no significant radio bursts or shock-related frequency sweeps observed from this event. The flare duration was a respectable 39 minutes. This flare produced a moderate intensity SID/SWF at 01:57 UT on 04 December, which ended at approximately 02:36 UT. Frequencies up to about 17 MHz were noticably absorbed during this period over sunlit portions of the earth. This flare was associated with minor VHF enhancements.

Considering the lack of complexity in this group, it is almost surprising it managed to spawn such an energetic x-ray flare. The region is more active than it apparently should be, by observing the data which has been collected on the region thus far. It has not grown significantly over the past 24 hours, nor has its magnetic gradients changed much. It is therefore, difficult to predict what this region may do next.

Aside from the major M6.6/1F Tenflare which occurred early on the 4th, Region 6397 also managed to produce a class M1.8/1B flare at 14:39 UT on 04 December. This flare, located at N08E51, lasted for 38 minutes and was not accompanied by any significant radio emissions.

If Region 6397 continues to behave as it has over the past several days, it could conceivably erupt with another major flare. The Space Environment

Services Center expects this region to continue to produce M-class flare activity with a slight risk of another major flare over the next 3 to 5 days, depending on whether it detensifies or not.

Flare probabilities for the next 72 hours (ending 07 December) follow:

Flare	Probability		
Type	24hr	48hr	72hr
Class M Flare	60%	60%	60%
Class X Flare	20%	20%	20%
Proton Flare	05%	05%	10%

Flare activity will likely remain elevated for the remainder of this week due to Region 6397's level of activity. The return of old Region 6368 on 11 or 12 December may increase the risk for M-class flaring even further. By that time, Region 6397 will be approximately half-way to the western limb. However, it is distinctly possible that Region 6368 has stabilized now (or even died on the far side of the sun). We won't know until 11 or 12 December.

POTENTIAL TERRESTRIAL IMPACT FORECAST

The major flare of 04 December is not expected to have a terrestrial impact. Its lack of association with shock-related frequency sweeps and small-size (in addition to the rather poor trajectory for any mass ejections) seem to indicate that the risk for a terrestrial impact from this event is small. It will, however, require close monitoring as it nears the solar meridian. If it grows or increases in magnetic complexity, the risk for PCA and proton activity will increase, particularly as it crosses over to the western solar hemisphere (which it will do in about 4 days - by 08 December).

There is a strong risk for potentially frequent SID and SWF activity over the next 3 to 5 days (at least). M-class flare activity should provide approximately 1 to 2 potential SID/SWF-capable flares per day. SID durations could exceed 50 minutes. SWF affected frequencies could exceed 15 MHz on the sunlit hemisphere of the earth. There is likewise, a moderate probability for associated VHF enhancements from some of the minor and/or potential major flare activity over the next several days at least.

Geomagnetic activity is not expected to increase as a result of the recent major flare. However, a well positioned coronal hole will likely begin affecting geomagnetic and auroral activity over the next 2 to 3 days (05 to 07 December). Radio propagation conditions may deteriorate over middle and high latitudes during this period. Low latitudes are not expected to be seriously affected. Effects from this coronal hole should diminish by 07 or 08 December.

Jay Maynard and I propose the following reorganization of the rec.ham-radio hierarchy:

PROPOSED ADDITIONS:

1. rec.radio.ham

"A General newsgroup for discussions about amateur radio."

2. rec.radio.ham.legal

"A newsgroup for the discussion of legal aspects of amateur radio."

3. rec.radio.ham.packet

"A newsgroup for discussions about amateur packet radio."

4. rec.radio.ham.swap

"A forsale group for the rec.radio.ham hierarchy."

PROPOSED DELETIONS:

1. rec.ham-radio

Now superseded by rec.radio.ham and rec.radio.ham.legal.

2. rec.ham-radio.packet

Superseded by rec.radio.ham.packet

3. rec.ham-radio.swap

Replaced by rec.radio.ham.swap

Commentary Period: Dec. 4 -14, 1990

I have the Alinco 570T and it doesn't require any modifications to cross band repeat. There's a switch on top labeled "radio repeat". Just put it in repeat and you're in business. The easiest way to handle "one way repeat" is to use the odd split option and program memory nine for an out of band frequency. It will refuse to transmit there. I use a FT470 and can monitor the repeater while accessing it via the "one way repeat" of the Alinco. It's like having a 45 watt HT. CTCSS encode and decode are standard equipment on the 570T. If you haven't bought a 590 yet, take a hard look at the 570 first. It's cheaper and does what most folks want right out of the box. If you don't really *need* remote touchtone control, it's a real win.

The KISS TNC is more than a dumb modem. It does channel access control, monitoring for a clear channel before keying up. It controls txdelay and tail timers essential for packet over radio. It implements a P-persistence backoff algorythim to avoid congestive colapse of the channel. It buffers packets in onboard memory. It implements a framing protocol on the serial link. It does the HDLC framing and bit stuffing and NRZ to NRZI conversion needed to implement packets. And it needn't cost "hundreds" of dollars. Most TNC2 clones are in the $105 to $130 price range. The "hundred" dollar range.

Channel access control is vital to the health of packet channels and it's a real CPU cycle waster. You don't want to have to do this in your PC.
To do HDLC you'll need special hardware in your PC because you definitely don't want to bit bang this in software, your standard serial port doesn't know how. That special hardware is an 8530 card that's going to cost $130. Which PC timer are you going to steal to do the txdelay and tail timers? What random number generator hardware are you going to use to implement P-persistence? Unless you just want to attempt it for the challenge, don't try packet with a dumb modem. It won't save you money.

Of interest to some is the fact that Old Fart is somewhat unisex which can not be said of Geezer. But then Old Fart also tends to infer a certain mindset.

Of course here in Greater Disneyland wimin often refer to each other as "guys". It is not uncommon to see a Valley Girl walk into a bar and great her assembled soulmates with "Hi you guys!". Not a testosterone producer amongst them.

This of of course points out that the gender of forms of address is not really that important.

Kepler is not the really humbling example in celestial mechanics.  That
honor goes to Isaac Newton, not much later.  After deducing that gravity
followed an inverse square law, he explored the consequences of that
(including deriving Kepler's Laws) so thoroughly that the greatest
mathematicians of the next two centuries basically just added footnotes
to his work.

The idea behind this is to move the ham radio groups into the same hierarchy as the other radio groups. The hierarchy rec.radio was created a couple of years ago to hold rec.radio.shortwave, and has acquired other radio-related groups since then; it's the logical place for ham radio, too.

(Side note: Please make sure that discussion is posted to news.groups as well as rec.ham-radio. This is required by the Guidelines for Newsgroup Creation.)

Houston 4 Dec 90 - 17:00 UTC

There have been some success and some problems with SAREX (Shuttle Amateur Radio EXperiment) on STS-35. On the first inflight test of the bridge system (2 Dec 90 0316 UTC) we were unable to make any contact with Ron. We have confirmed that he had a weak voice contact sometime before the bridge test time with a station in Florida.

On the second bridge schedule, which was to be a realtime connection between Ron, WA4SIR, and a classroom of children on school, we were unable to establish two way contact with Ron during the pass over Sao Paulo, Brazil. We did hear him for about 10 seconds of the 10 minute pass but couldn't establish conact. The most likely cause of the weak signal is the orbiter attitude during the contact. The SAREX antenna is in the right side window on the flight deck and at the time of the Sao Paulo pass the orbiter was tail down. The orbiter attitude is determined by needs of the primary payload.

A second bridge system test was scheduled for a pass over Australia but Ron was unavailable at the time of the pass (4 Dec 90 0205 UTC) and no contact was made. Ron was also asked to attempt direct contact with W5RRR on orbit 30. This contact was successful, Roy Neil talk to Ron for about 7 minutes as he passed south of Houston. Ron said that he had heard us full quieting on the pass over Sao Paulo but we couldn't hear him. The orbiter attitude was good for this pass which confirms that the orbiter attitude is important. This pass had only a 6 degree maximum elevation in Houston, we believe elevation and range are not significant factors in making a contact with the shuttle.

The amateur radio voice contact with the Mir space station is uncertain at this time. The first close conjunction (53 km) with Mir was to occur today (4 Dec 90) but the Mir crew is unavailable for radio contact due to the docking with the Soyuz and arrival of the new crew. The next close conjunction (57 km) is about 4 hours after the SAREX stow time on Dec 11. This contact can only take place if mission controllers approve delaying the stow of SAREX and the mission is extended the extra day. Vance Brand has been brushing up his Russian language skills which he learned for the Apollo-Soyuz mission.

The packet robot has been operating on schedule (included below). As of this morning (4 Dec 90 1600 UTC) over 400 contacts have been made with amateur radio operators using packet. If you experience weak signals on the downlink, it is likely that the orbiter is in an unfavorable attitude for you. It can improve or degrade as the orbiter passes depending on which side of the orbiter is facing you. The attitude is constantly being changed to support the telescopes, so if you experience weak signals, try again on later orbits.

Packet Robot Operating Schedule

03 Dec 90 03:19 - 16:19 UTC
04 Dec 90 03:19 - 15:44 UTC
05 Dec 90 03:19 - 15:34 UTC
06 Dec 90 03:19 - 15:49 UTC
07 Dec 90 03:19 - 15:34 UTC
08 Dec 90 03:19 - 15:44 UTC
09 Dec 90 03:19 - 15:34 UTC
10 Dec 90 03:18 - 15:04 UTC
11 Dec 90 02:49 - 14:34 UTC (only if mission is extended one extra day)

The element set (below) is from JSC based on orbiter state vector, the

NORAD data is different by about 7 seconds on equator crossing times. The JSC 2 line set has 00035 for the object number, whereas the NORAD set has 20980. If you had set JSC-012, there is really no need to update to this one, the difference is small (about 10 seconds).

Newton certainly killed the 2-body gravitational problem, but many
aspects of the many-body problem were better understood 200 years
after his death than at his death. In particular, while it took
more than 200 years to come up with the modern theory of stability,
200 years of perturbation theory revealed enough to make it plausible that
the solar system could be stable for billions of years
without invoking the hand of God to fix things up.

I've heard 3W4VL (Vietnam) on the low end of 15 meters (CW) the past 2 nights, and finally punched through last night. QSL via UA3DK, I think.

I had not heard about this beforehand. Is this guy for real?

I believe that the GTE is identical to the MITEL MT8870, in case
you develop a source for those. Contact local distributors for
availability. MITEL phone in California is (408) 249-2111.

In other words, to try to cover up their impotence in dealing with the
sharks, they plan to make a big show of beating the crap out of the guppies.

Wonderful concept! No wonder young people feel such total contempt for government.

Are we to infer from your constant references to the fact that you participate in the ARRL program to educate the FCC on what's happening in the real world that the League approves of this FCC "Whack the Guppies" policy?

[Sorry to offend the rec.ham-radio.legal proponents, but if you look up from your ivory tower technical tinkering some day and discover that the politics of regulation have eliminated the hobby altogether, don't ask why "somebody" failed to notice and take care of the problem.]

The WABASH VALLEY AMATEUR RADIO ASSOCIATION, INC., will be host to any and all hams who wish to work the William B. Gaskins Memorial Club Station, W9UUU, or any of the club members who are operating their own station and announcing that their station is participating in the special event.

The special event will be from 1300Z Saturday, December 8, 1990, until 0300Z Sunday, December 9. (That's this Saturday from 8 am until 10 pm EST.) See the December, 1990, QST.

All bands (except 30, 17, and 12 m) and all modes will be used, depending on the members' preference. W9UUU, the club station, located in Terre Haute, Indiana, will be on the air for the special event on various frequencies that conform to band usage, propogation conditions, and operators' prejudices.

Stations wishing a certificate should send their QSL card and SASE to:

```
                  +-------------------------------+
                  | (CALL OF THE STATION WORKED)  |
                  | C/O Wabash Valley ARA, Inc.   |
                  | P. O. Box 81                  |
                  | Terre Haute, IN  47808        |
                  +-------------------------------+
```

A certificate will be mailed as soon as possible.

```

Thanks to Phil & Gary for putting me right about what is required for a packet TNC. The handling of HDLC obviously poses a problem. I am now starting to appreciate what is involved. I was hoping a 16Mhz '386 would be able to do the job, even if it meant polling the line for individual bits.

I'm a lot handier with a compiler/assembler than I am at drilling metal, so I prefer software solutions whenever possible - they're easier to upgrade too..

In the meantime, I'll start with RTTY...

Mike

To which I'd like to see the addition of 'rec.radio.cb'..sounds silly comming from me, right? The notion is advanced that in giving people a _place_ for discussions related to the use of CB radio, perhaps it will foster some healthy growth and change there.

Additionally, there might be a trend towards involving more people in the _hobby_ of radio, since CB can be a stepping stone towards a ham ticket.

Consider this a vote FOR the plan, with or without my proposal, nice job!

Then what IS the basis for the 120V +/- 5% if not rms? Seems like the only
fairly repeatable reading would be peak to peak...

BTW, there is all sorts of interesting hash riding on the 60Hz sine wave.
Solid state power controls may be the least of the problem; inductive
loads can put a lot of crap on the waveform, too.

The higher the voltage, the less it will drop when you key your 1 KW
transmitter!

I was visiting the local HRO at lunchtime and happened to meet the
visiting Alinco rep. He was showing off all of the remote features of
the DR-590. Apparently he has been doing quite a bit of research to
figure out the thing, including taking trips to Japan and interviewing
the design engineers.

He said that almost all of the basic codes were in the manual but that
the were very lightly covered. One pair of codes that were not
mentioned were D99 (cross band repeat ON) and D01 (cross band repeat OFF).

Contrary to what others have said on this forum, I saw him change frequencies on both bands from the remote radio. He was going in on 2m and out on 440. He was able to set the 440 frequency as well as the 2 meter frequency by remote control. He indicated that only PL and repeater offset could not be set remotely, however he did acknowledge the trick of putting a shift in one of the ARM memories which he learned from a user. He said that even the engineers in Japan were unaware of this.

I asked him about documentation and he said that they were faxing it out to all the stores which carry it. Apparently one can call them as well (FAX: (213) 618-8758 or Voice: (213) 618-8616).

The comment was made that when the Japaneese brought the radio out to the U.S., they only mentioned in passing that the rig could be controlled remotely. Apparently, they never thought much about it themselves. They (the Japaneese) were surprised at how much commotion their American sales reps made about it.

In talking with the sales rep, it became apparent how all of this has transpired. It was pointed out that you could do anything from remote that you can do via the touch-tone pad on the microphone. I also asked him if this included the limitiations - it did. You also cannot select shift or PL directly from the microphone pad.

This leads me to speculate that what has happened here is that remote control of the radio was developed by "accident" as an outgrowth of the ability to control the rig from its microphone touch tone pad. It seems that when the dsq (dtmf decoder) was added that these features suddenly became available. This would explain why the radio has been called an "almost great" in that the remote-base functions are "nearly complete". Perhaps it was never designed to begin with.

I would further speculate that much will be learned by both Alinco and its competitors from this radio and that by next year a "complete" or fully functional remotable rig will be available.

I can't wait :-)

I've acquired a Philips monochrome video camera from a junk sale, and am looking for details on connections to it. The usual suppliers of service sheets have never heard of it - have you ?

The camera is marked '8925 002 50401' and is tube-based (Vidicon ?). Connection is via a captive lead with a 7-pin DIN plug. The cable contains 2 screened leads and 4 other leads. There is a 5-pin DIN socket mounted near the lens (perhaps for auto iris control ?). The camera is about 6 inches long, and the circuitry is protected by an anodised aluminium cover. There's an orange lamp on top.
I'd guess from it's size and lens quality that it was intended for use as a cheap security camera.

I can get composite video out of it by supplying it with 9V dc. I chose this value because it results in about 6.3 V on the tube heaters - seemed like a good idea at the time... This supply also results in voltages on the tube neck between -50 and 300V, from an internal inverter.

The picture is reasonable, but suffers badly from after-images. I don't know much about camera tubes, but it may be that it's being driven incorrectly (wrong voltages) or perhaps it's just the way these devices are.

I'm looking for more precise information about the power supply than my guesswork, and confirmation that the tube is being driven at the right sort of level. I'd also like to know about the signals I'm not using on the interface cable - two of them appear to be sync inputs (if I provide them with about 4V of sync, the internal sync generators will lock onto it) but that still leaves 2 pins unaccounted for. One appears to be an input, and the other an output.

Any ideas ? Or lectures on the care and feeding of camera tubes ?

-adrian

At 9:00 Am PST on Saturday, no wonder it's an east coast phenomenon.

I expect to spend considerable time in France early next year. My daughter and I are both hams and would like to be able to communicate with each other on 2 meters while we are there. We have sent away to ARRL for info, but I thought I'd ask if anyone had more information.

Is there reciprocal operating with France (vs US)?

We don't speak ANY French - is that a problem?

Has anyone out there in net-land ever operated in France with a reciprocal license?

I`am happy to anounce, that you now can get the best and most used
packet radio program, from iesd.auc.dk (130.225.48.4)
as anonymous ftp.

The program is placed at
/pub/ham-radio
And the name is
pcmb510.lzh

If you use it please E-mail, to me so that we can send you information
about neu things....or developments of this fine program..

There is also developt a remote contole program to Kenwood radio`s
but there is not English docomentation..... but it will come

Hallo Welcome to PCMBOX.

*** PCMBOX Copyright (c) 1990 OZ1HMN ***

What is PCMBOX ????

PCMBOX is a Packet terminal program with many features including mini mailbox,
21 commands based on the // principle.

PCMBOX is written in Turbo Pascal(tm) by OZ1HMN and is a shareware program
fully Copyrigthed by OZ1HMN. It is forbidden to sell and may not be used
to any commercial purposes.

Now some of the features:

Yapp is supported in terminal as well as in mailbox mode.

A log is updated every time you connect someone, and a seperate
log file for mailbox users.

You can call an External program within PCMBOX.

You can connect via the routing list (Alt-C).

```
        Setup of your favorit editor.

        Setup of your favorit viewer.

        Create a mail file within PCMBOX.

        RX buffer containing op to 400 lines.

        Trace (look for) specific text received, and then beep.
```

And now a dump of the 3 help screens:

<<General re-naming of rec.ham-radio and adding .legal deleted.>>

It seems the only effect of this reorganization is the addition of rec.ham-radio.legal, other than the name changing.

Why is this a Good Thing? Why not just add rec.ham-radio.legal and leave the rest of the structure alone? Is it not simpler (and prone to fewer screwups) to do this instead of renaming everything?

The 100th Anniversary of Major Edwin H. Armstrong

Major Edwin Howard Armstrong, famed radio pioneer was born on Dec 18, 1890, and fell to his death on Feb 1, 1954. He is credited with being one of the most important inventors in the field. Among his inventions are four basic discoveries that revolutionized radio, and made possible the present state of the art. These include: the regenerative circuit, which took radio out of the crystal detector stage; the superheterodyne circuit, the basic circuit of today's standard radio; the superregenerative circuit, used in military and UHF communications; and the FM communications systems which achieve static-free high fidelity reception. He attended Columbia University, and became Professor of Electrical Engineering at the school.

The members of the Major Armstrong Memorial Amateur Radio Club will be commemorating the 100th anniversary by operating Special Events stations December 15th and 16th from 1400Z to 2300Z on the following amateur bands:

```
10 meters--- 28.400 Mhz +/- 25 Khz on SSB.
2  meters--- 145.03 Mhz Packet Radio with the call of W2FMN which may be
             reached via the K2LSX-2 NetRom Node.
220 Mhz----- 223.42 Mhz Packet Radio with the call of K2LSX which may be
             reached via the K2LSX-3 NetRom Node.
Club Voice Repeaters located in Northern New Jersey:
             222.080 in/223.680 out W2VH/R with PL 1B (107.2).
             222.640 in/224.240 out W2QAQ/R with PL 1B (107.2).
             441.525 in/446.525 out W2VH/R with PL 1B (107.2).
```

Members will be using their own call signs. Special Certificates will be available for those making contacts with a member station. To receive a certificate, send a completed QSL card and a 8-1/2" x 11" SASE to:

MAMARC

Now that we're on the subject of Zepp antennas ... it is OK to have
the top part of the antenna slope at an angle, like an inverted V? That's
the setup I have. So far, it seems to work OK.

I must admit to, on occasions, having used 'Old Thing' as a suitably

non-specific term.
(but CWers would abbreviate this to OT, which has ageist implications!)

Rfc@briar.philips.com (Robert Casey), kchen@apple.com (Kok Chen), and julian@bongo.uucp (Julian Macassey) ponder:

>>> ... how the Chinese would do a code ...

>> ... possibly have used PinYin ...

>   ... there is a code book that assigns a 4 digit number to each
>   Chinese character ... in the old days ... this translation to and
>   from was tediously done by hand ...

In mainland China (the People's Republic of China), they do it by the four-digit code method, although pinyin is also common. Pinyin itself is insufficient to spell out proper nouns (such as people's names and addresses) which sound the same but are written different. An analogy might be spelling "Ann" and "Anne" as both "an", and "Stephen" and "Steven" as "steven".

Telephones are scarce in the PRC. A residential phone costs more than a regular worker's monthly pay. If you work at an office (say a bank) you get to use the official phone for private conversations, at least for receiving calls. Otherwise, if you're in a hurry, you send telegrams.

To send a telegram, you go to the post office. You write out the letter in longhand and give it to the clerk. There are about two to three thousand Chinese characters in common use. At every post office in the PRC, there is a clerk who has memorized the entire four digit code table. He takes the message, and immediately starts sending it to its destination. At the receiving end, another clerk writes down the message as it comes in, and hands it to a delivery person who then takes it to its addressee. All in all, extremely efficient and impressive.

Why, you may ask, do they take such pains? One reason is lack of technology, another is an unwillingness to replace man with machine. But there is a historical reason as well. China has undergone many dynasties, some harsh, others cruel. During the current regime, people have witnessed again that one may lose jobs due to ideological reasons. If you have technical skill that cannot be readily replaced, however, you tend to survive purges. So memorizing four digit codes for a couple thousand characters is a sound investment.

Incidentally, there are people in police departments who know the license plate numbers and owners of vehicles registered in their precinct by heart. Another useful skill.

--- SOLAR TERRESTRIAL FORECAST AND REVIEW ---
December 01 to December 11, 1990

Report Based In-Part from Data Obtained from the
Space Environment Services Center
Boulder Colorado

SOLAR TERRESTRIAL REVIEW FOR 25 NOVEMBER TO 01 DECEMBER.

Solar activity over the past week was low to high. The most significant event was a major class M7.5/1N flare which erupted at 23:17 UT on 26 November. This flare was accompanied by minor radio emissions and was accountable for a low to moderate intensity SID/SWF at 23:12 UT. The flare was located on the extreme western limb (N18W90) within the confines of Region 6368. The duration of the flare was 17 minutes, which is below average for flares of this intensity. No proton enhancements or shock-related frequency sweeps were observed from this energetic event. The flare did not produce any terrestrial impacts aside from the short-duration SID/SWF which accompanied the flare on the sunlit side of the earth.

Since 26 November, there have been only two low-level M-class flares, one from Region 6377 (which has now rotated beyond the west limb) and the other from an uncorrelated position on the solar disk. This last M-class event was a long-duration class M1.2 event lasting 1 hour and 23 minutes. Although the source for this flare has not been determined, evidence seems to indicate that it probably originated from new Region 6395, which rotated into view on the eastern limb on 01 December. This region has a relatively large spot area, encompassing a total of 10 sunspots as of 01 December in an FKO type optical configuration. It is a type Beta magnetic group (bipolar) and is not expected to be a very prolific flare producer in its current state.

The solar flux reached its apparent minimum value of 157 for this solar rotation on 26 and 27 November. This minimum flux value is the highest minimum to be observed since the rotational minimum of 06 and 07 August, which was followed within two weeks by a pulse of increased solar activity and major flaring.

The geomagnetic field was mostly quiet throughout the last week, with the exception of 27 November when a burst of major storming occurred over middle and high latitudes. Boulder reported an associated A-Index value of 35 at 18:00 UT on 27 November, which surpasses all previous middle-latitude magnetic perturbations up to 10 and 11 October, when geomagnetic activity managed to push Boulder's A-index values up to 44. More frequent and intense storming occurred over high latitudes, although the overall geomagnetic activity was relatively short-lived. By 28 November, the magnetic field had returned to predominantly unsettled levels and quickly declined to quiet levels for the remainder of the period.

Some periods of auroral storming occurred over high latitudes during the burst of magnetic activity on 27 November. Middle latitudes witnessed increased auroral activity, but no major auroral storming materialized. Low latitudes were unable to spot auroral activity, which remained confined to the high latitude regions.

HF radio propagation remained mostly normal throughout the week, with the exception of increased magnetic and auroral activity on 27 November. Significant auroral-induced signal flutter was observed over many middle latitude locations while high latitudes experienced characteristically poor to very poor auroral-degraded propagation conditions. However, HF conditions improved quite rapidly to near normal levels on 28 and 29 November.

There were a few flare-related SID/SWF's this week which are suspected of producing degraded HF propagation conditions. However, almost all of the SID's/SWF's which occurred this week were of low intensity and short duration (with the exception of the estimated 1.5 hour low to moderate intensity SID/SWF of 01 December. No significant VHF enhancements were observed from these SID's/SWF's.

VHF propagation was near normal this week. There were no known reports of DX contacts made via auroral communications, although there were brief bursts of activity which could have been capable of providing localized VHF backscattering to moderate distances. The rapid stabilization of auroral and geomagnetic activity did not provide very good opportunities for auroral-based DX on VHF.

SHORT TERM SOLAR TERRESTRIAL FORECAST

Solar activity is expected to remain mostly low over the next week, barring any new major activity centers rotating into view. Region 6395 will continue to provide subflaring and occassional C-class flares. However, this region does not currently appear as though it will be capable of producing many (if any) M-class flares. The next potentially major pulse of activity is expected between 11 and 12 December when old Region 6368 returns.

Geomagnetic activity is expected to remain mostly quiet to unsettled this week. There is a risk of unsettled to active periods occurring on or near 05/06 December due to recurrent effects. High latitudes may experience some brief bursts of minor storming with this activity. However, overall, activity is not expected to be particularly strong. Conditions should return to mostly quiet to unsettled levels by 07/08 December.

Auroral activity will remain at low to non-visible levels until 05/06 December, when increased solar corpuscular emissions are expected to produce moderate levels of auroral activity at high latitudes. Middle latitudes will likely only witness low levels of auroral activity with possible brief bursts of moderate activity low in the northern horizon near local midnight.

Lunar phase will interfere with attempts to view auroral activity this week. The moon, which is at full phase now (on 02 December) will flood out much of any observable auroral activity over low and middle latitudes. High latitudes will be best positioned to view auroral activity after moonrise. However, even there, any auroral activity will appear less distinct and somewhat harder to spot. As the week progresses, moonrise times will allow for some short-periods of moon-free evening-twilight observing periods.

HF radio propagation conditions should be mostly normal throughout this week. High latitudes will experience degraded conditions with the onset of expected increased geomagnetic and auroral activity near 05/06 December. Middle latitudes will likely also experience periods of degraded conditions, particularly during the evening/night hours of 05/06 December. Daytime propagation over middle latitudes should be normal throughout the week. Low latitudes should maintain normal propagation conditions all through the week provided signal paths avoid the northerly-middle and high latitude regions during the evening/midnight and early morning hours.

VHF conditions should remain normal this week. No significant opportunities for DX are expected this week. The only possible exception to this would be on 05/06 November when increased auroral activity may allow for some limited localized and sporadic auroral backscatter propagation on VHF. However, activity is not expected to be intense enough to provide widespread backscattering from most high and almost all middle latitude stations.

SUMMARY OF ALL ACTIVE REGIONS VISIBLE ON THE SOLAR DISK AS OF 02 DECEMBER

Region #	Location	LO	Area	Class	LL	Spots	Magnetic Type

    |_________________________________________________________________|
```

NOTES:

This graph ONLY depicts geomagnetic conditions observed at Boulder, Colorado for the past 87 hours. Conditions to the north of Boulder will generally have slightly higher activity than Boulder, while conditions to the south of Boulder will likely have lower activity than those depicted here. However, the plots should present a good approximate average of planetary geomagnetic conditions.

For information regarding the interpretation and/or use of these charts, send a request for the document "Understanding Solar Terrestrial Reports" to: std_oler@hg.uleth.ca. This document is still being prepared and is not yet available.

NOTES:

Predicted geomagnetic activity is based heavily on recurrent phenomena. Transient energetic solar events cannot be predicted reliably over periods in excess of several days. Hence, there may be some deviations from the predictions due to the unpredictable transient solar component.

               Cumulative 60 day Solar Activity Record
                   Start Date:  October 4, 1990
```

NOTES:

Left-hand column digits represent the 10.7 cm solar radio flux obtained from Ottawa. The right-hand column describes the relative solar activity for that period based on the average number of major and minor flares that can be expected for related solar flux values. Plot lines labeled with the letter "F" represent days where at least one major flare occurred (ie. class M5 or greater flare).

```

NOTES:

These VHF DX prediction charts are defined for the 50 MHz to 220 MHz bands. They are based primarily on phenomena which can affect VHF DX propagation globally. They should be used only as a guide to potential DX conditions on VHF bands. Latitudinal boundaries are the same as those for the HF predictions charts. For more information, request the document "Understanding Solar Terrestrial Reports" from: "std_oler@hg.uleth.ca". This document is still being prepared and is not yet available.

But then to a Swede, to see a porn movie or a regular move where the girl is called Bo Derek can be very confusing. To some cultures the question is whether Bo or Derek is the given name. There may be some CW ops who fantasize that Derek has blond hair, blue eyes and a reasonable pair of 36Cs. This may account for his success in nabbing the DX.

I just wish people would not come back to me as "Juliet". One station did it to me for three years.

Then what are we going to do with all the Kims, Leslies, Robins and for total confusion Jeans. Then we have all the Hippy names like: Free, Chastity, Moon Unit, Dweezle, Keefer, and Quinn. The sex of these names is anyones guess.

This at least is a change from the usual CW flamage.

I would assume that what would be used in CW is "Chinese Code". In the TELEX world, there is a code book that assigns a 4 digit number to each Chinease character. This way a simple baudot machine can send Chinese. Of course in the old days of 3 In 1 oil and TELEX machines, this translation to and from was tediously done by hand. I assume today that a simple piece fo software running on a graphics machine like a Macintosh could do it on the fly. Fifty baud is not really flying, so any machine should be able to keep up.

TELEX for those of you who have not seen the clanking monsters that sat in the back of every self respecting European office is landline RTTY. Same machines, same protocol.

Now I making an assumption. Maybe someone really knows what the People's Liberation Army of the PRC really uses for CW purposes.

Well it works, so it must be okay! My 80 meter antenna is somewhat bent
and wrapped around the yard, not exactly as described in antenna books.
But it works okay! Moral - any antenna is better than no antenna.

GROUP NAME: rec.ham-radio.legal

MODERATED: No

PURPOSE: The group is intended to provide a place for discussing any and all subjects having to do with laws, rules, and regulations affecting amateur radio and hams, both current and proposed.

The rationale for the group is simple: rec.ham-radio postings fall into two categories - controversial and non-. There has been much discussion in the past several weeks about what to do with the seemingly never-ending flame wars over the same few subjects, such as whether or not a class of license that doesn't require passing a code test should be created; the legality of modifying ham equipment to transmit out of the amateur bands; the permissibility of using electronic equipment on airplanes; and other issues that generate more heat than light. These discussions share one thing in common: they all relate to the rules and regulations governing the amateur radio service.

The new group has been discussed in rec.ham-radio, and, by and large, has received no serious opposition. Most comments received that did not support the proposal instead suggested a rec.ham-radio.tech group, for technical ham radio discussions. I do not believe that that's the best answer. There are a number of activities in ham radio that are not technical in nature; a rec.ham-radio.tech group would move the technical discussions away from the controversy, but would leave the non-technical, but non-controversial, discussions in with all the legal and controversial ones.
The proposed rec.ham-radio.legal group doesn't suffer from this flaw.
Agreement is pretty general among the readers of rec.ham-radio that something needs to be done, and I (and many others) feel this is the best solution.

The Call for Discussion is being mailed, per the Guidelines for Newsgroup Creation, to the moderator of news.announce.newgroups on Friday, 30 November 1990. Assuming that it is posted to that group on Monday, 3 December, the discussion period will last for 28 days, ending on Monday, 31 December 1990.
If a vote is appropriate after discussion, it will be called for at that time.
I anticipate that such a vote would run for 21 days, from 31 December 1990 until 21 January 1991.
Please note that voting is not appropriate at this time; calm, reasoned discussion is. Please post any discussion you may have, pro or con, to news.groups.

I was just informed by the SAREX coordinator at ARRL that NASA plans to show some video of Ron Parise's amateur radio activities this Thursday evening.

Scheduled time for "Mid-deck activities: SAREX" is 6:04 p.m. PST on Thursday, December 6th.

Early reports are that Ron successfully talked to his dad yesterday via a direct contact, but there were problems this morning with the more complicated linkup between a couple of U.S. schools and the shuttle via a ground relay station in Brazil. Cross fingers that everything gets straightened out in time for Tuesday's scheduled school contacts. (They're going to try to reschedule the schools that missed out this morning.)

Also, more than 200 hams have made contact with the robot packet-radio system. I watched at 2:20 a.m. local time this morning as our own netperson Mike Chepponis, K3MC, became contact #116. Ron is in his sleep period now but will be starting up the robot again this evening.

Patty

DOUBLE OOPS?

Upon third reading of the Sarex schedule I posted, seems a few UTC values didn't want to cooperate and remained at zero. Read these UTC values for these three MET times:

MET	UTC
2 20 30	5 3 19
5 8 45	7 15 34
7 19 0	10 1 49

As always: If at first you don't succeed . . .

Check this month's QST for news on what the FCC did to fellow
netperson K1MAN. Sometimes, you do not have to wait for st. Peter.

73 and happy holidays,

Here is an updated element from sci.space

======

Here are the Keplerian elements for STS-35. These were generated from
a state vector taken after several orbits.
--GaryM

Keplerian Element Set

Someone asked where to get the EDMEESE program. (I lost the message, so I can't reply by e-mail.) Anyhoo, it's widely available on Fidonet type BBSes and deals with the Fidonet FTS-0001 format messages. An equivalent for Unix boxes ought to be easy to put together with AWK.

However, for those who ARE using FTS-0001 format, I'll pick up up a copy of EDMEESE.EXE pass it along using e-mail and uuencode to those who request it.

-> I am posting this for our Amateur Radio Club the 'River City ARCS'!
-> Have two(2) 'Systron Donner' Model 1626-01 MicroWave synthesizers (Sweep
-> Generators) for sale! They cover the range of 40 MHz to 27Ghz, have a
-> Digital Readout with DBM meter(Digital), and a IEEE 488 Remote Control Port.
-> They were Built in September 1982 and the warranty ended September 1983.
-> I understand that when they were new they cost around $20,000!

The above equipment has been sold!!! It sold in less than 12 hours from Posting here on the net!!!   Thanks to all who contacted us, it was on a FCFS.
(First Come First Sold)

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

In article <27080030@col.hp.com> bobw@col.hp.com (Bob Witte) writes:
{
{ There is a full-page ALINCO ad in Dec QST which claims that
{ their 2M/440 dual band transceiver (DR-590T) has DTMF remote control
{ capability as well as crossband repeater function. This sounded
{ interesting to me --- put a transceiver on a mountaintop,
{ use an HT on 440, crossband repeat onto 2meters.

I have one and overall am quite impressed.
Yes indeed you can use the radio as a crossbad repeater/remote base, but
there are a few "gotchas". You can do the same with a number of other rigs
too BTW and you might well find a cheaper one if that is the only thing
you really are after.

{ I called Alinco and got the following disappointing story.
{ Almost everything can be controlled remotely including power
{ level, crossband repeat on/off, frequency and memory recall.
{ The bad news is that the transmit offset cannot be selected.
{ (I never did get an answer to whether the rig automatically
{ choses offset on 2M. The guy said that "most repeaters in
{ the US have - offset.")

Your info is correct, but you DO need a $40 "DTMF control" option to do
this remotely, but you can do this from the DTMF mic. "out of the box".
Testing the functions using the local mic. can save you a lot of trouble
in getting set up!

The functions are 3 digit codes starting with a hex C (16 button
DTMF). The functions (in order) are: Cancel, VFO mode, Memory mode, CALL
mode, ARM mode, VHF main band, UHF main band, power level, up one Mhz, Down

one Mhz, set DSQ code, select DSQ code, set autodiater, select autodialer, transmit autodialer.

{ The Alinco guy's suggestion was to use the Memories instead.
{ (i.e. have all your favorite repeater freq's stored in memory
{ which does remember offset.) Only problem there is that the
{ memories can be selected only using "next memory up" and "next
{ memory down" control functions. There apparently is no "go to
{ a particular memory" function. This is OK until you forget
{ where you are.

I assume that "next memory up/down" corresponds to the "one Mhz up/down" in remote mode just like it does on the front panel. I haven't tried this.

Figuring out "where you are" is a problem with remote operation regardless of the mode that you are in though. I don't have a simple solution.

{ I found it hard to believe that they had such robust functionality
{ but left out some critical features.

They have done this is several areas, what is there is good but with just a few tweaks they could have been "the radio of the nineties". Hopefully they (or someone, maybe the FOX-Tango group?) will issue software upgrades to fix some of this. The potential performance is truly spectacular!

{ Can anyone confirm or deny what I've stated? Anyone have this
{ radio?

I hope this answers your questions. And Yes I do have the radio :-)

My plans are to use it as a mobile and then use my IC24AT to control it as a remote. Since I will generally be in the vicinity or returning to the car frequently (at least twice a day :-)), the remote operation can be relatively unsophisticated.

A couple of other problems though: (1) to enable cross-band repeat you must cut a wire that inhibits out of band operation. BOTH TX and RX! THat could be a real problem with remote operation. (2) THere is no easy way to have a "one way repeat" i.e. UHF-to-VHF only. THe reverse (VHF-UHF) will then block out your remote if you key up a repeater with a "tail". I excpect to use the PL option for this though (another $45 option :-( ).

Overall thoough it is a really nice rig, I do hope some ambitious group decides to put together fixes for some of the silly limitations though.

*Mike Waters   AA4MW/7 waters@dover.sps.mot.com *

There is no right way to do wrong.

The FCC never busted any police departments back east. The only involvement I ever heard of with teh FCC and Police Radar was a complaint filed by a truckers group about police in Oregon setting up old defective radar units along the highway with solar cells. These units would still transmit but not receive. The units would then trigger the detectors in areas the police considered as hazardous, and caused traffic to slow.

The FCC became involved and the 2 (maybe 3) police departments discontinued the practice.

It is currently policy in at LEAST one state police and many local police departments to LEAVE RADAR ON during a traffic stop. This has been statistically shows to SIGNIFICANTLY reduce the number of officers injured during trafic stops. The FCC is mute on this, as well as various motorist groups, at least so far.

The notion of a separate group for legal/rules issues of Amateur "Ham" Radio seems to be a good one. Certainly it is an appropriate split of existing traffic.

I wish that there would be a smallish reorganisation of the whole Amateur Radio heirarchy to move it to be of the form:

rec.radio.amateur.*

rather than the existing

rec.ham-radio.*

The reasons for this are several:

1) The existing name predates the other rec.radio.* groups and getting the Amateur Radio area more consistent with other groups on similar topics helps make it easier for folks to find and post to the correct groups.

2) The net is sent world-wide and has much more international traffic than it did several years ago and many net.readers aren't familiar with jargon words in English like the term "Ham Radio" to mean Amateur Radio. The use of Amateur Radio avoids the use of jargon and makes it clearer to all folks what the topics of discussion are there.

Perhaps there could be an independent vote on renaming the heirarchy piggy-backed onto Jay's proposal so that the two ideas would be voted on separately as part of the same ballot. I don't know how Jay feels and my idea is very much a trial balloon, but I'd like to at least see it be thought about by the interested parties...

Regards,

Randall

Someone recently asked about ICS Electronics ltd; their current address is:

ICS Electronics Ltd.
Unit 5
Rudford Industrial Estate
Ford
Arundel
West Sussex
BN18 0BD
England

Phone: 0903 731101

ICS seem nowadays to act as retailers for AEA gear, although they used
to produce hardware in their own name.

What's wrong with that? At least some high government official SOMEWHERE cares
about ham radio, even if the FCC doesn't.

Besides, it'll give me a chance to come up with a cheap 2 meter all-mode rig.

I had a lot of fun in the Un-Net this Saturday. Many thanks to Alan, K6XO for his sterling work as net control under some very difficult conditions. We experienced some very variable propagation, as well as some very confused non-net hams who kept checking in (& out !) I'm only sorry I had to leave before the DX checked in, I would like to work Tobago & Guantanamo Bay on 10 sometime..

I presume the net will be pre-empted by the contest next weekend, but lets hear from some more people the week after.

I have a question about packet. If I intend to run TCP/IP, and use Phil Karn's NET-PC package, it seems that I will end up putting the TNC into 'dumb mode' and basically using it as a modem. I haven't bought a tnc yet, and it seems I don't really need one. Am I right in thinking that all I have to do is build a modem that turns 2 tones into high & low levels on an RS232 line, and connect it to the PC? (levels to tones for transmitting).   Why should anyone spend hundreds of $$ on a tnc when the PC can do the work, assuming you already have one.

Can anyone point me to a circuit they have used successfully with the NET-PC program? I can probably handle the modem part, but presumably there is some handshaking protocol that has to be done correctly.

Thanks and 73
Mike KC1RP

>elements defined by Kepler are still being used by astronomers and satellite
>trackers worldwide.

Actually, it was a __long__ time ago. Kepler published his work on elliptical motion in "seu Physica coelestis tradita commetariis de motibus stellae Martis" in 1609! This contained the first two laws: orbits are ellipses, and equal area = equal time. In 1619, he published "De Harmonice Mundi", containing the third law, which relates distance to orbit period. In 1620, his mother was arrested for witchcraft.

So, the basic work was done 371 years ago! This is one of the humbling things about celestial mechanics. I'm sure I wouldn't have been able to figure this out, yet Kepler did it 371 years ago. Obviously, he didn't have computers. Most people don't realize that he didn't even have the benefit of a telescope. The telescope was invented around 1609; Galileo pulblished in 1610. The observations that Kepler used to develop his theory were made by Tycho Brahe, many years earlier.

Well... I just wanted to thank everyone who had given me help on Amtrak information. I'll be "train mobile" Dec 14-15, QSL via buro, pls... (hee hee I'm not serious). It should be a lot of fun... Maybe next time if this works, I'll rig up my 747 and see if HF will work too....

On another note, I will be leaving school after this semester and will no longer have access to a BITnet node. I know that there are a couple of ways I can still access from the "private sector", but I'm not sure about any of them. I have my own PC and might be able to get access to a FIDOnet node.... I'll be in the NYC (516 area code) area. Any suggestions?

73's for now....

Todd Perry

I've fed my tower, a seventy foot Rohn 25 tower with a tri-bander as a
```

top hat, using a gamma match. I made the gamma rods from 1/2" EMT spaced 6" from a tower leg using PVC pipe. I used three gamma rods, one each for 160m, 80m, and 40m. One rod per leg of the tower. I used remotely tuned gamma capacitors. It worked pretty well on transmit, but atmospheric noise on receive forced me back to horizontal antennas. I now use a 535 foot horizontal loop mounted 55 feet up. I feed it with ladder line and a tuner. Works nice.

{>1) How do I answer a CQ? I hear a guy calling CQ, and I want to answer him,
{>but how? What do I send? Like I say, I'm pretty ignorant.

[a lot of good suggestions deleted]

{15 meters is good during the day, and sometimes to surprisingly late into
{the evening. Since you have an advanced ticket, you can use any HF band
{you want--just call CQ at a low speed. Just about everyone will try to
{match your speed when they answer you. Or search for someone else calling
{CQ at a speed you can copy. You'd be surprised at how much slow-speed
{CW activity there is, even on 20 meters.

One point you should find quickly by listening a while, but is still worth mentioning, is that there is a general convention for speeds to get higher as one goes towards the low end of a band. Not a "hard and fast" rule, but dont try calling CQ at 10 Wpm on 14.026 for example (or 14.005 for extras). You will find the speeds and general sophistication MUCH higher there than at say 14.110. For your first few CW QSOs though the 40/80 meter novice bands are hard to beat, just don't be afraid to try other frequencies once you get the hang of it!

If you are persistant enough to learn to do it well I think you will find that CW has some VERY unique advantages that make it a whole lot of fun.

Oh yes, after all that I STILL favour a no-code license! THere is room for both IMHO.

November 30-December 2 marked the 21st Annual ARRL 160 Meter Contest, and for the 21st year our group participated as a multi-single station.

Our call this year was K1LT (Calls also used in the past were W8LT and K8ND), and our final results are listed below:

QSOs: 958
Mults: 85 (Missed KV4, VE5, VE8/VY1; 11 DX countries)
Score: 165,665

Operation was from the Ohio State University Radio Observatory north of Columbus Ohio, with participation by K1LT, K8ND, NZ4K, KU8E, and KC8MK.

Station was Drake C-Line (R4C heavily retrofitted) and 8877 amplifier.

Transmitting antenna was a 30-foot high top-loaded vertical mounted on a 2.5-acre aluminum foil ground plane (part of the permenent radiotelescope on the site), fed through approximately 600-feet of RG8/U.

Receiving antennas included six beverages (NE, SW, E, W, S, N) and an experimental 4-element switchable, phased, voltage probe array consisting of four 3-foot voltage probe vertical rods ground-mounted.

The above score represents more net QSOs than any of our past efforts, and about the same number of multipliers as netted last year, when we posted the top score in this contest. We know that we were beaten this year by K2WI, who posted 902 QSOs and around 94 multiplier.

Are there any other scores out there? If so, we'd like to hear about them! Please send information to me by packet (K8ND @ W8CQK) or by EMAIL (packet preferred).

>>Bob Witte writes some stuff about putting a 590T on a mountaintop and using
>>an HT on 440 to corssband repeat onot 2meters.

>Then Mike Waters AA4MW/7 writes some junk and then . . . a number of other
>rigs [do the same thing] and you might find a cheaper one if that is the
>only thing you really are after.

Well not quite
Most other rigs dont allow the remote controll including QSY that the Alinco does.

Mike then writes:
> couple of . . . problems . . .: (1) to enable cross-band repeat you must
>cut a wire that inhibits out of band operation. BOTH TX and RX! THat could
>be a real problem with remote operation.

This is completely incorrect. When you cut the wire it ENABLES out of band operation.

He then continues:
>There is no easy way to "one way repeat" i.e. UHF to VHF only.

This is incorrect. If the DTMF squelch is enabled on both 2m es 440 then the proper tone sequence is required to open the squelch and you can use your ht to RX and your remote base to TX.

Furthermore as I posted last month, I have been working with Dexter and Greg at Alinco and have found a way to automatically control the offset.

All (standard) repeaters below 147Mhz use - offset. All repeters in the 147Mhz sub band use positive offset. So this is how you set up the rig.

1 Store a repeter frequency (positive offset) (from the VFO) in the ARM memory.

2 enter a repeter frequency below 147Mhz and switch to - offset.

3 now when you qsy above 147 Mhz the offset will be + and below 147 Mhz will be -. This works for all VFO functions i.e. band scan, mic-pad frequency entry, and remote (ht) control.

If you have other questions regarding this rig let me know and I'll see what I can do for you.

You can try around the popular "QRP frequencies"

3.560
7.030
14.060
21.060
28.060 MHz

The majority of these people will make you very welcome, are happy to stick around and help you or just plain ragchew. If you can adjust your output power down to about 5 Watts, you'll make friends for life :-)

Their signals will be small, but they will be quite prepared to work locals. I find these frequencies to be oases, away from the worst of the p*** off-you-are-not-DX mentality.

some of the very best operators are to be found here.
I define a good operator as one with skill,ability, good manners and patience. (i've got the patience, the rest I've got to work on :-))
People who can do fast morse but lack the other characteristics just don't qualify.

Hi everyone,
One of the local officiers, who is also a ham, has a lot of fun with his
radar unit!  When he spots a car with a radar detector in the window, he
likes to track the car, with the speed gun OFF!  Likes to watch the
reactions of the drivers trying to figure out why their detectors didn't
alert them to his radar!!

Happy and safe holidays!

Christians believe salvation comes by faith and faith comes by grace. No
amount of "doing" earns brownie points. It is a simple question of obedience:

                  "Go, thou, and teach all nations."

There, that isn't so difficult to understand at all, is it?

Well, I tried! After taking my 10 meter vertical down and repairing the storm damage, I could finally hear the un-net. Or at least, I could hear K6XO (5/5) consistently, and KC1RP occasionally and I could tell there were other people there, but not what they were saying. And I called, and called, and called, and called, and called. On CW as well, just in case. I guess 100W to a 5/8 vertical ain't good enough.

It's not *quite* that simple. The packet "framing" method used in amateur packet radio is HDLC, which is a member of a class of "synchronous" link level protocols. The standard serial ports in PC type computers cannot support synchronous protocols, so you either need a synchronous interface

chip (e.g., Zilog 8530) or you need to generate the output in software
one bit at a time. The former method is much preferred.

You can buy cards that provide both the HDLC framing and modem functions.
DRSI has the PC Packet Adaptor, while PACCOMM has the PC-100 and Hamilton
Area Packet Radio has their HAPN card. A new group in Ottawa has just
come out with an HDLC card that supports DMA (invaluable for high speed
modems) but it does not have an on-card low speed modem.

Once you have one of these cards you should be able to configure NOS
to run with it.

If you are using a crank-up tower, you may need to worry about obtaining
a good electrical connection between the sections. The Rohn 25 should
work fine.

I'd be interested to know what gives you that impression. Having recently discussed some of this with the FCC, I have a different impression entirely. They are insistent that both the FCC and the amateurs themselves have the capability to detect improper use of amateur frequencies. The oft-cited continuing use of amateur frequencies by taxicabs, boaters etc. is irrelevant. There is a big difference (in the FCC's eyes, at least) between not having sufficient enforcement capability to catch all of the illegal activity and not being technically *able* to catch them. They may grudgingly put up with the former, but they are unbending about not allowing the latter to happen any more than they can help it.

You seem to have answered your own question. :-)

When dealing with nonresonant dipoles and skywave propagation arriving at various undetermined polarizations, the only practical answer is to use what works. Theory says that we want the high current part of the antenna as high and in the clear as possible to minimize losses. Theory also says we want the antenna confined to one vertical plane to obtain maximum broadside gain over a point source. Confining the antenna to one horizontal plane will optimize it for one polarization. Since we don't know the optimum polarization for a given skywave path, we aren't too concerned about this. However, with a Zepp, on certain bands the antenna will behave as two end fed halfwaves in phase. Therefore the current maxima will occur halfway down each leg rather than at the feedpoint. Keeping these points as high and in the clear as possible is important to minimize losses. And to maintain maximum broadside gain from the pair of end fed halfwaves, they should be confined to the same horizontal plane. If not, they will be cross-polarized at the Vee angle, usually 90 degrees, to each other and not exhibit maximum gain. Thus the answer is that a flattop is better than a Vee for frequencies where the Zepp is not approximately a halfwave. Again practice rears it's ugly head. If you can't mount the Zepp as high as a flattop as you can when it's a Vee, then the Vee may perform better in practice.

Few of us are lucky enough to have an ideal antenna field with no obstructions, ideally placed supports, and highly conductive ground. Thus we make do with what works given our situation. Theory reminds us what considerations are important, but only experimentation will show us what works best given our practical limitations.

John's right about this one. The local field office busted the DeKalb County Ga. police department for this one. They were very blatent however in that they mounted surplus radar units on expressway signs and just let them run. Their intent was to make radar detectors useless by generating many false readings. The field office busted them for transmitting false and misleading signals as well as for intentional jamming. The local field office also busted the State Patrol for failing to have transmitter ID cards attached to their radar units. The Field Engineer in Charge likes to drive fast. :-)
On a somewhat related note, the regional EPA office busted the Gwinnett County Police for illegal tampering with emission controls in order to make their crusiers run faster. Guess what EPA officer likes to drive

fast. :-)

I have a baffling TVI problem, and I'd like to see if anyone else has encountered anything similar. "Something" within about 150 meters of my antenna is apparently rectifying my 15 meter signal, and generating a harmonic at 63 MHz. Harmonic generation in the rig and antenna system have been ruled out. TVI only appears with the beam pointed in on particular direction, which happens to also be toward the affected television. (Fundamental overload has also been ruled out.) TVI is more severe when transmitting on either of 2 wire antennas, which are more or less parallel, with their ends pointed in the direction in which the beam causes interference. When transmitting on the wire antenna, however, the position of the beam makes no difference. The beam still causes interference with the two wire antennas down, so the wires themselves are not the source. Now the strangest thing of all: When the harmonic is observed with a spectrum analyzer, it appears to be modulated by a very erratic 60 Hz square wave (at the power line frequency, precisely), but only when transmitting on one of the wire antennas. The harmonic is much stronger using the beam, but shows no modulation. Reducing power with the beam does not cause modulation to appear. There are lots of power lines and poles in the critical direction, but a search with a portable receiver was inconclusive. Needless to say, the 15 M fundamental never shows any modulation, regardless of the antenna used. The only explanation I can think of is that a vertically polarized component induces current in a vertical ground wire on a utility pole, which may have a flakey connection which results in rectification and modulation. Since the beam is horizontally polarized, it induces current in a different part of the power lines, which somehow still generates harmonics, but without the modulation. The wire antennas, of course, have a significant vertically polarized component off their ends. (They also slope.)

Any ideas out there? I'm ready to start pounding on those power poles with a sledgehammer. Please reply be email.

Here's a sample service bulletin - # 948

SB-948
TS-440S NOTCH FILTER LOW FREQUENCY IMPROVEMENTS   01/20/89

The low frequency attenuation characteristics of the notch filter can be improved by reducing the input level to the notch filter chip (IC1). To compensate for the loss of input level, the amount of negative feedback to the audio amplifier (IC7) will need to be reduced. This modification is already incorporated in all models beginning with serial number 704XXXX.

REQUIRED PARTS:

120K OHM, 1/6 WATT RESISTOR	RD14CB2C124J
390 OHM, 1/6 WATT RESISTOR	RD14CB2C391J

1. Disconnect the power supply and antenna.
2. Using a #2 Phillips screw driver, remove the 9 screws from the top cover. Remove the top cover from the transceiver and unplug the speaker wire.

3. Locate resistors R86 and R229 on the component side of the IF board (Figure 1).

4. Using a #1 Phillips screw driver, remove the 7 screws that secure the IF unit to the chassis of the transceiver.

5. Pull the board up and rotate it towards the front of the transceiver to expose the foil side of the board.

6. Desolder and remove both resistors from the board.

7. Install and solder a 102K ohm resistor in place of R86.

8. Install and solder a 390 ohm resistor in place of R229.

9. Assemble the transceiver by reversing steps 1 - 5.

This is an optional change that may not be performed under warranty.

146.94 machine is on Squaw Mtn at 11,700....still formidable but not
like the .97 machine. It runs about 100W though and can be heard a LONG
ways out on the High Plains. It also is situated so that It can be
usable all the way to the Eisenhower Tunnel on IS 70, 40-50 miles West
of Denver. I have even worked it from the ski lift at Loveland ski area
at the Continental divide at the tunnel.

The.. umm... transponders (yeah, thats it) I have read about mostly AM
modulate a microwave carrier with a tone. By the time it comes out
of the detector, the receiver sees the modulation rather than the beat.
That way you don't have to do any adjusting for what his actual
transmitting frequency is (as long as you get the band right).

If you frequency shifted his signal with a mixer and retransmitted just
a few hundred hz away I think you would have feedback problems

```
(and need REAL hi Q filters to remove the unwanted mixing products).

There is a major glitch with the TH-77 with its memories.  If you let
the battery die down with the radio turned on, you will lose all
memories and the radio will reset.  Removing the battery pack with the
radio on does not affect this, only letting the battery pack die.  Terrible
engineering flaw...

You can accomplish the same thing just by switching the transmitter
on and off, which is a little easier than AMing, especially when using
a Gunn source. Not quite the same, but it should still produce the
desired effect.

>If you frequency shifted his signal with a mixer and retransmitted just

Very true. Plus you'd have to track his drift and also worry about
your own car's speed.

I'm not quite sure what a "Grappler" is, but let us assume it is a printer interface box(?). I am further assuming that there are one or more cables connected to this thing.....

There are several things you could try...

1) add a ferrite core over the cable(s). A proper core might be one inch long by 1/2" square with a 1/4" hole down the center. The shape could also be 1/2" round. Some of these are split length-wise so they may be retrofitted around existing cables such as yours. A standard torroid may also work, but you want to loop the cable 1-2 times around the core.

2) add shielding around the main circuit board. I assume that the enclosure is plastic. Try lining it with aluminum foil or other conductive stuff. Make sure the case halves join together electrically all the way around. The I/O connector grounds (shield connections) also need to be attached to this foil at the point where the connectors enter the enclosure.

3) You were correct to try bypassing internally. Is there a crystal oscillator? If so, make sure it has a 0.01 uF from Vcc to ground pins (short leads). Also add 0.01 uF caps across all other ics. There are other internal mods which are really beyond the scope of this discussion. One of which would be to add a ground plane layer (insulated foil would work) under the pc board and then connected to the cable shield connection of the connector. By the way, make sure that neither the enclosure foil nor the ground plane layer touch pc board connections!!! Use plenty of insulating tape.

Go ahead and get the 2SAT...

To open up the receive range:

1) turn off radio

2) press and hold the "B", "#", and "Light" keys

3) use your third hand(!) and turn the radio on. Keep the keys pressed until the display settles out (2-3 seconds).

You now have 118-136 am, 136-400 (about?) fm. Any frequency may be stored into the memory channels. Nice radio.

I am new to amateur radio and am currently in the market for a dual-band 2m - 70cm HT. I have narrowed the search to two units, based primarily on budget constraints.   The two in question are the Kenwood TH-77A and the Yaesu FT-470. I would appreciate any comments, or experiences any of you have had with either of these two units.

Thanks,
John Levin   JLevin.ElSegundo@Xerox.com

I am looking to load up my 55 ft crank up tower for 40. 80 and 160M.

As anyone actually done this and if so what type of matching system did you use? I do not mind using my antenna tuner, but I would of course like to have a closer match at the antenna so that I do not burn too much power in the coax.

Any input is welcome!

Assume I'm calling CQ:

CQ CQ CQ DE NJ6A NJ6A NJ6A K

you would answer:

NJ6A NJ6A DE KK6MY KK6MY -AR-

where -AR- is didahdidahdit.

I would then answer with something like:

KK6MY DE NJ6A GE OM TNX FER CALL UR RST 599 QTH SAN RAMON, CA NAME HR JERRY HW CPY? KK6MY DE NJ6A K

In English this is: good evening old man, thanks for the call. Your signal report is 599. My location is San Ramon, Ca. My name is Jerry. How do you copy?

Pick up a copy of the ARRL Operating Manual. It has all you'll need to know. The key point is to just get on the air and give it a try.

>2) On what frequency do I answer the CQ? If I hear him, do I answer him on
>that frequency, or do I move the dial until his tone is at the lowest point?

You adjust your transmitter so it is zero-beat with the received signal. This is very easy to do with a separate tx-rx combination, but it can be done after a fashion with a transceiver. I also have an Icom 735 and I do it as follows: tune your rig until his tone is at approximately zero beat and then tune it up 800 Hz (0.8 on the display). The 735 has an 800 Hz Tx shift on CW. Unless he has a 100 Hz filter, he should be able to hear you without a problem.

>3) Which bands would you recommend for a beginner? Obviously, the novice
>sections of the bands are good. I like 40 meters, but broadcast stations
>usually obliterate the band.

15 meters is good during the day, and sometimes to surprisingly late into the evening. Since you have an advanced ticket, you can use any HF band you want--just call CQ at a low speed. Just about everyone will try to match your speed when they answer you. Or search for someone else calling CQ at a speed you can copy. You'd be surprised at how much slow-speed CW activity there is, even on 20 meters.

If you hear WA6XYZ calling CQ, just send:

  WA6XYZ WA6XYZ WA6XYZ DE (your call 3 times) K

>2) On what frequency do I answer the CQ? If I hear him, do I answer him on

>that frequency, or do I move the dial until his tone is at the lowest point?

You want your carrier frequency to match his. On most transceivers, this means you tune until his signal matches the pitch of the sidetone oscillator (what you hear when you transmit). This is typically around 700-1000 Hz.

>3) Which bands would you recommend for a beginner? Obviously, the novice
>sections of the bands are good. I like 40 meters, but broadcast stations
>usually obliterate the band.

40 meters is good during daylight hours. 80 meters is good at night.
This is for short distance rag-chewing (couple thousand miles or so).
15 meters is a good "DX" band that is less crowded than 20. 15 is usually open during the day.

Do what I do... I program all NON-ham repeater pairs with the offset in
the opposite direction (but by the correct amount). In the case of repeater
outputs in the 450-455 MHz range, you would be transmitting in the ham band.

However, the desert is at 5000-6000 ft. MSL, so the HAAT is not that
unusual. Also, Sandia is apparently a very noisy site (all of Albuquerques
TV stations transmit from there, along with LOTS of other services).

Mt Taylor, 90 mi West of Albuquerque is pretty impressive, and can be
linked up to repeaters in the Sangre De Cristo mountains near Taos.

I would like to know what software is being used for decoding Dove? Is it

still the program written by nk6k that was distributed shortly after the micro

satellites were launched. Any information would be appreciated.

Is the new software for using the microsats store and forward bbs on line?

If so, can it be gotten via ftp? Any information would be appreciated.

Yeah, What are the standards?

DIN A6 is sort of standard in Europe (That's 148.5 mm x 105 mm (5.85"x4.13"),
but I've also seen 90x140 (mm) which is about 3.54"x5.51"...

When you've solved the problem with non-metrics some standard would
be fine for QSLs :-)

I LOOK FOR A ANTENNA ANALYSIS PROGRAMM FOR THE COMMODORE 64. THE COMMODORE MACHINES ARE NOT SOLD HERE IN BRAZIL SO IT IS VERY HARD TO OBTAIN SOFTWARE FOR SUCH COMPUTERS. MANY C=64 ARE USED BY HAMS HERE. SOMETIME AGO I SAW A SHORT NOTE IN A HAM MAGAZINE ABOUT A SOFTWARE FOR ANTENNA ANALYSIS USING THE C=64. THE NAME WAS SOMETHING LIKE "MAIL-ORDER ANNIE".
CAN SOMEONE HELP ME WITH INFORMATIONS ABOUT HOW TO GET THESE OR ODER SOFTWARE? ARE THERE SUCH SOFT IN PUBLIC DOMAIN? I HAVE NO MODEM FOR MY COMMODORE SO IT REMAINS FOR ME THE POSSIBILITY TO RECEIVE A DISK BY THE POST.
I WOULKD LIKE TO THANK YOU IN ADVANCE

I think that you hit on the worst aspect when you wrote that there was nothing in your manual to warn of impending memory loss and what to do afterwards. Unless the exact models at risk and the action to be taken become well known, Icom run the risk of their other models being confused with the 751 etc. Some people have told me already that they had heard that all Icom gear made after some date had this "feature".

It certainly sounds as if the problem is not so bad, if only band edge values need reprogramming. The idea of a ROM/RAM substitution is probably the most confidence inspiring solution. A QST article would help to de-fuse matters, help people, and help Icom avoid the consequences of any overreaction.

With such a small amount of data, perhaps it would be feasible to use a really crude switch-box programmer ?

Sincere thanks !

From the context and the name, I can guess what EDMEESE does; the
question is, if such a program already exists, where can I find it
(unfortunately, no FTP access here)?

Years ago, at a job far far away, under the name Mikey at trsvax, I posted an article to rec.auto entitled "The Hitch-hikers Guide to Radar Jamming". It brought a torrent from a few net.police types, and a FLOOD of mail requesting more info.

So, I will not repost, but.....

The only practical economical method of jammimg is to overload the front end of the unit by transmitting pulse mode, which is an illegal mode for X-band ham.

Secondly, the new Radar units are much more sophisticated than in 1980. The last unit I looked at had 2 indicators of interest on the display. One was "RF". This went on when the radar unit detected RF energy above a certain strength that MIGHT interfeer with the radar unit, and the unit would shut down the reading and calculations. This is to prevent interference from on-board radios in the cruiser, but I don't at this time know all the details.

The other indicator is "JA", for JAM! This is activated whenever the radar unit detects a jamming signal. I do NOT know if it looks for the pulse or what, but in snooping I SUSPECT the new units put modulate a tone on the carrier and the JA goes on when the unit can't detect it's own tone. But then, I'm not sure. Do YOU want to risk you drivers license AND your HAM ticket?

Mike Yetsko
InterLan

I don't have a radar detector, it's an application specific field strength indicator.

This is an interesting problem. How does a manufacturer build in frequency limits which may change after every WARC meeting? Although the Icom design might be improved on (say with a EEPROM or something like that), it's still a better solution than the one that came with my Kenwood 940. I assume the processor microcode PROM must be removed & sent back for reprogramming if the band edges widen. Either that, or I could incur the wrath of the net and disable band limit checking altogether by "cutting the wire" :-) It looks to me like Icom ought to have designed in a way to update the contents of that RAM while installed in the transceiver...maybe it was planned but just didn't make it into the final firmware release.

I am the owner of an ICOM 745 which also contains code in RAM. I have known about this problem for sometime and like many other readers of the group have been somewhat puzzled as to why ICOM would do such a thing. After reading this posting, their logic has become clear to me.

By putting the bands and their edges in RAM, ICOM created radios that can be reprogrammed to reflect new band allocations or changes in the existing band edges. I remember what a problem the new WARC bands created in the early '80s. Everyone had to trash their old equipment and buy new stuff. With the 745/751/751a, all we should have to do, after the '92 WARC, is send the boards back to ICOM for reprogramming with the new allocations.

A second reason they might have done this is profit. It was probably cheaper to design one radio that could be used throughout the world, and then program in the band allocations for the desired country. This way, the same board could be used world-wide, and excess inventory in one country could be diverted to another country just by reprogramming the board!

I like the idea of a replacement ROM board, but it might be smart for someone designing one to wait until after the '92 WARC so they can include any changes that might be made.

I have a handheld Scanner from DAK, Regency R 4030, that boasts 800 MHz band coverage. Well actually it gets part of the 800 band on the high and low side, but the middle of the band has been locked out. I was wandering of anyone new of a quick fix that will "unlock" these frequencies. Since the PLL is capable of capturing even up into the 900 MHz band I assume it's not a problem with the capability of the unit but rather Regency purposely is restiricting these channels.

I had heard about clipping some diodes or something like that. This scanner looks identical to Bearcat scanners except for some of the plastic colors. The R 4030 is a 200 channel programmable handheld if that helps any with identification.

I just finished balking with ICOM about this battery deal. They say
they recently check an ICOM 751a that has been used less than 10% of
the time. The battery shows no signs of quiting after 8 years. They
expect it to last between 10 and 15 years.

They stated that the following models are affected by the RAM battery
issue:

ICOM IC- 745, 751, 751a, R71, 271, and 47

No other ICOM radios are involved. They said the reason for their use
of RAM was because it was the only RFI immune chip at the time.

(I am just relaying their comments!)

A local group here is building a repeater controller using the 8052 Basic uController.

Does anyone have a copy of the October 1988 issue of QEX that would copy pages 3-9 and 15? This article evidently describes the use of this device, and is needed to complete the project.

Any help would be *greatly* appreciated.

Hi,

I was wondering if anyone out in netland knew of the location of the latest version of Berkley SPICE. I would like to FTP a copy for my SUN, but don't know perzactly where to look.

Thanx,
Chuck Harris - WA3UQV

Actually, I have no reason to access my home computer from work. If I did I could just call up the telebit at my house and get fast reliable transfers. (I only have a 1200 bps TNC.) However, I don't have internet access from work. So what you suggest is great! I could ftp sites, etc. from my house.

However, there is one flaw. Me as the end user on the packet side ftps to a site on the internet, through some packet/internet gateway (actually a router). Now I peruse that machines anonymous directory, and do a get on some file I *think* might be interesting. However, to my shocking amazment it contains some foul language (imagine a news digest).

See the point? I still think that this situation falls under the third party traffic rules. I am in contact with a third party who is using the gateway's station for its transmissions. Its just like when you use a phone patch to contact someone via another amateur station. If the person at the end of the patch uses unnacceptable language, then it is up to the operator of that station to do something. (I think repeater autopatches fall under a different set of rules.) On the same line of reasoning the operator of the gateway would still have to screen traffic from the internet side to the packet side.

Now mail would be o.k. One way mail. From the packet to internet. I see no reason why not.

I think that what I would rather see is a reverse of what Tad Cook and some other fine providers of ARRL bulletins do. Instead of forwarding from packet to the net, why not forward news (maybe the digest) to packet. I check out the local packet BBS occassionaly and the technical content of those messages is kinda low. I wish it were higher. Aren't the packet to news forwards manual? I guess they could be automatic. If there is someone out there that is reading the digest, then he could just select the good articles and forward them when he's done. Actually it could even be done through rn or trn.

Thanks

{
{Do what I do... I program all NON-ham repeater pairs with the offset in
{the opposite direction (but by the correct amount). In the case of repeater
{outputs in the 450-455 MHz range, you would be transmitting in the ham band.

That is one way to minimize the problem I will admit, doesn't work with the
AZ DPS on 460.xx though :-) For practical purposes using simplex will
minimize the QRM since they use a PL tone and a repeater. Of course if you
get into the repeater ...

I would much prefer a switch or wire to cut however. With a microprocessor
controlled rig it would be trivial to add TX enables for every 10 Mhz
segment for example, wouldn't even need extra pins on the IC/board since

the speed required is low enough to be easily multiplexed.

Now if *I* were designing it ... :-)

Except for any change in coax loss as a result of changing feeder length, you can not change the SWR of a load (the antenna at the other end) by changing feeder length. What you can do is to cause a change in the impedance seen by your transmitter--which it may like better because you have brought either the resistance or reactance into the range acceptable by your transmitter coupler.

{I have been a ham for 8 months, and have upgraded to advanced class. Would

{you believe that I've never made a CW QSO?   I really would like to get
{involved in CW, but I feel like a complete ignoramus. I have an ICOM-735
{with the built-in keyer. I have these questions:
{
{1) How do I answer a CQ? I hear a guy calling CQ, and I want to answer him,
{but how? What do I send? Like I say, I'm pretty ignorant.

THe best advice I can give is LISTEN! See what the other stations are saying. THat advice applies to just about any ham radio activity BTW, ESPECIALLY DXing and contesting!

The normal protocol is to call with a 1 X 3 response. If you were calling CQ for example I would send:

KK6MV DE AA4MW AA4MW AA4MW K

(1) send a little slower than the other station NEVER faster! I sometimes work the novice bands for fun and if someone responds to my 5 wpm call at 35 wpm the I will also send at 35 wpm - and sometimes find its someone "showing off". After a few years of CW the higher speeds are actually much easier than low speeds.

(2) give the station a few seconds (say 20 seconds) to respond and then repeat the call.

Once he responds to you then you can give your rig, QTH etc. just like an SSB QSO.

Feel free to use reasonable abbreviations but don't go overboard. Very few novices can interpret HPE CUAGN SN OM. A table of common "Q" signals is helpful though, you probably know more of these than you think and they were invented for CW.

Don't expect the other guy to be any more experienced than you are - it is a NOVICE band after all. You will both make mistakes, just try to learn from them.

{2) On what frequency do I answer the CQ? If I hear him, do I answer him on
{that frequency, or do I move the dial until his tone is at the lowest point?

Pick a tone that is comfortable, about 1khz. Transcievers are made to offset the TX frequency to allow for this. In heavy QRM use the RIT (if any) to adjust to a lower tone. I have used as low as 100 Hz (with an audio filter and 150 Hz mech. filter in the line too!) in really awfull conditions, but if things get that bad you should probably QRT.

{3) Which bands would you recommend for a beginner? Obviously, the novice
{sections of the bands are good. I like 40 meters, but broadcast stations
{usually obliterate the band.

I would suggest the 40M novice band in the DAY or 80M at night. Mostly because you WON'T get much DX so the QRM will be lower. THe QRM always gets worse after you start a QSO BTW :-)

Good luck and don't feel self conscious about mistakes, expect them and learn from them!

CW can be a lot of fun and is WELL worth the effort to master it - that means 30+ wpm though not just 13! Get some cassettes with conversations (or W1AW) and listen to them in the background while you do something else. Before a year is out you will be hearing 30+ wpm with no problem.

There have been several programs written in BASIC and published in the ham magazines over the years.

Perhaps the one you desire which seems to answer the question of the earth's curvature between points of interest was printed in 73 Magazine, December 1978, pg 174. An additional article on the same subject, but less comprehensive was printed in 73 Magazine December 1977, pg 106.

>"CM". If we had a LMM (we don't), it would id as "MI".

Well, almost. The LOM/LMM IDs do follow that pattern, but it's not the airport
ID, but the ILS ID that they correspond to. In the case of the first or only
ILS at a field, it's the same as the airport ID (usually), but others bear no
relationship to the airport ID at all. Houston Intercontinental is a good
example: it has 6 ILSs, and only one can be IAH. The rest are things like
JYQ, CJF, ...

(I bet the folks out there weren't aware that us pilot types have to deal with
some things that are stranger than even the FCC's worst machinations! :-)

I'm interested in getting into TCP/IP. It dawned on me that someone must be coordinating the radio IP addresses. Could someone tell me who to get in touch with to get an IP address assigned to my station?

Also, is anyone familiar with who's running TCP/IP in Texas, and in the Dallas area specifically? And what frequencies?

I plan on running the KA9Q package...

Thanks,
Dwaine

I note that lots of exchanges include the HW CPY? on each call. Does this question refer to another signal report or an inquiry as to how much of the transmission did the other fellow get?

There's been some discussion here about my proposal for rec.ham-radio.legal. It's been mostly favorable, and so I'm going to proceed with the formalities getting the group created.

There's been some sentiment for a rec.ham-radio.tech group. The idea, as I understand it, is to move the technical discussions away from the flamage, than the other way around. I have only one problem with this idea: there's more to ham radio than just technical issues. A .tech group would leave the rest of us wading through the legal flamage to find articles of interest that aren't technical, but aren't controversial either.

I feel that .legal is the most logical split to move the flamage, and leave non-controversial articles, available in the group. Hence, I'm sticking with the original proposal.

Expect to see the formal Call for Discussion in news.announce.newgroups next Monday morning.

For the last couple of years, the local ARES organizations have set up a booth at one of the local Malls (Newpark Mall in Newark, CA) to send holiday traffic for shoppers.

This year we expect to be asked if there is anyway to send message to service-people stationed in Saudi Arabia.

Therefore:

Is there any NTS link to MARS (or any other way) to send traffic from an NTS packet station to service people overseas?

By the way, the most difficult problem is finding shoppers that know the telephone numbers and zipcodes in order to send proper NTS messages. Hopefully, significant prior publicity will help this year.

Holiday cheer to all,

****

Jerry, can you please explain to us how you know that the person calling is
male?   I find it impossible to distinguish male cw sending from female cw
sending, so I would really appreciate knowing the secret.  I wouldn't want
to address a male ham as a female, or do the reverse.  I'm sure you don't
want to perpetuate the idea that only males can be radio hams, or do you?

I just received this note on packet. It might be of interest to those who own Uniden 10-meter transceivers and wish to use them on packet and/or AMTOR:

```
 Msg# TSP  Size To     @ BBS  From    Date  Time Bid
15362 PY   1569 KD2BD         N7ETV  901130 1711
Subject: UNIDEN QSK MODIFICATION
```

Thanks!!! to Craig, N7ETV for the following info...I will copy this to all of you who responded to my message.

Mike/KA3NVP

HELLO:

AFTER HOOKING UP MY HR-2600 TO MY PK-232, I FOUND I HAD SOME PROBLEMS USING IT IN AMTOR. SINCE I LOVE TO MODIFY AND "FIX" RIGS, I GRABBED MY TEST EQUIPMENT AND SET OUT TO FIND OUT WHY THERE WAS A LONG SWITCH-OVER DELAY TIME. AFTER A FEW MINUTES, I FOUND OUT THAT THE RECIEVER WAS COMMING UP OK. IT WAS THE MUTE CIRCUT THAT WAS SLOW. I FOUND TWO CAPACITORS THAT WERE RESPONSIBLE FOR THE DELAY IN THE MUTE CIRCUT. TO FIX THE PROBLEM, CHANGE OUT C74 AND C99 (BOTH ARE 4.7uf @ 50VDC) WITH .01uf DISC CAPACITORS WITH A VOLTAGE RATING GREATER THAN 15VDC. THESE CAPACITORS ARE ALSO FOUND IN THE HR-2510 AS WELL. THESE SEEM TO BE C139 AND C99 IN THE HR-2510 IF MY COPY IS RIGHT. THESE CAPACITORS ARE LOCATED NEXT TO THE AUDIO OUTPUT IC (TDA1905) IN THE RADIO. THIS I.C. IS LISTED AS IC2 IN THE HR-2600 AND IC103 IN THE HR-2510. I ALSO FOUND THE S/RF METER TO BE VERY SLOW IN MY RIG. I FIXED THIS BY CHANGING C302 ON THE CONTROL UNIT (LOCATED NEXT TO J304) TO A .01uf DISC CAPACITOR ALSO. THIS CAPACITOR IS ALSO IN THE HR-2510. AFTER THESE MODIFICATIONS, I HAD NO MORE PROBLEMS MAKING ANY CONNECTS IN ANY MODE. 73'S AND ENJOY THE UNIDEN!

Coming from someone whose login is the trademark of the ultimate in macho womanizing males, I find your false piety ludicrous.

Linguistic pseudo-feminism is the hobgoblin of tiny minds. It's an easy victory in an unchallenging battle, and of no possible interest to anyone who has risen above the pharisaic.

Indeed, "OM" could have easily stood for "Old Mother", or perhaps even "Old Mother-....". So Jerry could be incorrect. But given the current distribution, he's more likely correct in imputing a male rather than a female on the other end of the connection. Now if you want to do something about THAT, you have a worthwhile target for your apparently overabundant energies. And you would stop annoying the rest of us while you're at it.

That is, if you think most hams are human. I often wonder.

I've commented on this before, but here goes again. I am very impressed with the FT470. I was a confirmed Icom'aholic before I got the 470. I think it is the best feature for the dollar radio on the market. It's extremely rugged with a metal case. I've now dropped mine off a tower and it survived. There are a couple of complaints keeping it from being perfect however. First, the receive audio is not very loud making it a little hard to use in an open jeep at speed. Secondly, the desk charger is a strict timed charger with no sensing. It can fry your batteries. Other than those two complaints, however, I love this radio. It's keyboard command system is among the easiest to understand and use of any of the HTs. If you use one for a week, you'll never want to go back to anything else (IMHO).

> without the supervision of a control operator.

Well, 'stating the message' - TO ME - means real time transmission. Any other
interpretation of the word seems to me to be unnatural 'lawyer-ese'.
Actually, the regulations seem to me to be based on an archaic understanding
of HOW third party traffic is transmitted. The regs just didn't envision the
"Look, Ma, no hands" capabilities we have now. They are a throwback to the
day when the only way anything got on the air was for a live human bean to DO
something NOW.

> Of course the control
> operator can use mechanical aids--I never said he couldn't--but the use
> of such aids doesn't absolve him of the responsibility to continously

I guess we differ on the meaning of 'continuously monitor and supervise'
also. To me, initiating an ongoing mechanical process and periodically
checking its report mechanism IS _continuous_ . Sort of like baking a cake.
You put it in the oven and check it from time to time. You don't need to sit
in front of the oven and stare at the cake through the little window.

If we take your definition literally, the control operator would not even be
allowed to blink.

> The FCC's major concern is not that someone might say a naughty word

I'll take that seriously after they get rid of the non-ham taxicabs,
truckers, boaters, and balloonists...

The 20 meter mess has taken a new turn. Herb KV4FZ and his BARF group have something else to take on, namely a new group. One with no official name. These guys started the 14.313 Peace Coalition net a couple months ago. They moved up from 3894.5. Originally they tried to talk to the Barf Group, but incompatabilities arose, and since both groups have "strong personalities", what has resulted is two groups that refuse to talk to one another, and if a member of one group happens to transmit while the other group has control of the frequency, they scream MALICIOUS INTERFERENCE, and they call the FCC. This is, of course going to do our hobby no good at all.

Since I work out of my home, runing this public access unix site, I am able to monitor 14.313/14.300 all day until band closing. I have heard some amazing stuff the past couple weeks.

The new group can only be called the HATE HERBIE NET. They get on and play tapes of Herb and the boys. Tapes recorded from 2 meter repeaters on St. Croix, and other recordings trying to show that the Barf people lie, and are hippocrites.

Barf, not to be outdone, comes on after the HATE HERBIE NET, and debunk all the stuff, and play tapes of their own, and the 20 meter war goes on.

I think EVERYONE out there with an HF rig should at least listen, so you know what is going on on these two frequencies. If you hear an orgainzed net without a lot of shouting and QRM, tune to the OTHER frequency. Sometimes go up or down a few KC, and you will hear the two groups badmouthing one another.

The problem I have with the new group (WB2PZT and COMPANY) is that they use very foul language, and are prone to talking in a manner that they call "Adult Entertainment". Those familiar with the stuff that is heard on 3868 and 3894.5 know about this off color stuff, and foul language. PZT (I think it was him, might have been one of the others) Got drunk on the air one day, and began using the F-word in just about every sentence. These boys have actually said right on the air that the FCC does not care what kind of language they use. I find that hard to believe.

If you are trying to introduce someone to ham radio, you would do well to avoid 20 meters. One day last week, a teacher came on who was there with his class (It was ADULT EDUCATION, FORTUNATELY) and was saying how this stuff does not sell ham radio very well.

I could not agree more. While I have to admit that I sometimes rather enjoy the confrontations, ESPECIALLY now that they are talking about something OTHER than Phone patches.

Thanksgiving night, HERB, KV4FZ, who is the anti phone patch KING of BARF Was in contact with a ship in the Persian Gulf, and ran many patches at his own expense for the guys on the ship. The HATE HERBIE group claims that when he did this, he "Commandeered" the frequency that they were in QSO on. I did not hear the beginning, but later HERB played back the tape he made on HIS END, showing PZT and the others YELLING while Herb was running the Patches. The yelling included the foul language that the group is famous for.

Now whether or not it is true that Herb took the frequency, these guys should know that by interfering and screaming while a patch is in progress, they only degrade the hobby. If that had happened to me, I would have at least kept my mouth shut til AFTER. And of course if I WAS on and someone wanted to run such patches, I would not mind giving up the frequency, and sitting back and becoming an SWL for a bit.

Listening to both sides in this dispute, one finds distaste for behaviour of both groups, and also some agreement with things the two sides present.

And the WAR goes on.

Herbie. Pay your fine.

Shall we parse the above statements?

  IF radar helps keep the highways slower / =safer, /[THEN] i'm all for it.

Perfectly good statement, however there is the implied postulate (or Theorem yet to be proved) "slower=safer". In any event, I'm all for letting him be all for it.

  Make radar detectors illegal everywhere!

Pray tell, how does this follow from the first proposition? There is (at least anecdotal) evidence that the use of radar detectors causes would-be speeders to be more conscious of their speed and (when the radar is near), actually slow down. This would appear to be a desirable effect. Yet, Mr. Heller would have us outlaw their use. The net effect of THAT would seem to me to be MORE speeding, with (possibly) higher revenues for the police; at least as compared to the legal radar detector scenario.

So which is it to be... road safety or more revenue?

Is there anywhere a file obtainable containing cyrillic morse code?
(Or turkish)?

I beleive the ARRL-book used to contain japanese and others but Russian?
(Cyrillic).

Will someone also explain what a "Oblast" is. Is it some zone-dividment in
USSR? If so -- How many are they and how do you express them in CW?
Any short-form (eg. OBL).

Do you use it out there? In the US?

Is there anyone having a C program to calculate one's locator and also
(especially this) calculating distance between two locators? (Of course
taking the ellipsoidical sphere form into account)

Sincerely yours,

>John Schmidt, NK0R

Amen to that! We just brought up a new machine with a S-Com 5K controller. This has got to be the best commercial controller available for the money. The construction is very high quality (we bought the rack mount option), and the system is fully programable via touchtones. Programming codes can be restricted to the control link, if you desire, on a code by code basis. So you can allow the general user community access to some functions while protecting others. Different levels of access are controlled by passwords, so you can have more than one class of user. There are command macros that you can build to allow complex functions be performed with a single command. There are auxillary inputs and outputs that you can use for external status and control functions. There is a real time clock allowing mode changes depending on the time of day. Link receivers and transmitters are easily accomodated. Full schematics and parts layouts are provided along with an exhaustive programming manual. And the price is right. Don't overlook S-Com if you are shopping for a new controller.

QST DE W1AW
DX BULLETIN 47 ARLD047
FROM ARRL HEADQUARTERS NEWINGTON CT
NOVEMBER 30, 1990

RELAYED BY KB8NW/OBS & BARF-80 BBS
TO ALL RADIO AMATEURS

THANKS TO ALLEN SINGER, N2KW AND THE TRISTATE DX PACKETCLUSTER NETWORK, STEVE, W9NUF, AND THE NORTHERN ILLINOIS DX ASSOCIATION, DOC, W9NSZ AND CARINE, ON7LX, FOR THE FOLLOWING DX INFORMATION.

ALBANIA, ZA. CHANCES OF WORKING ALBANIA BEFORE THE END OF THE YEAR ARE IMPROVING. IN ADDITION TO THE ANTICIPATED HUNGARIAN EXPEDITION, SEVERAL EUROPEAN GROUPS NOW CLAIM OPERATIONS WILL COMMENCE IN MID-DECEMBER. KEEPING TUNING.

ANTARCTICA. SEVERAL NATIONS ARE ACTIVATING THEIR BASES DURING THE ANTARCTIC SUMMER THIS YEAR. ZL0AAF AT SWAN BASE IS LOCATED ON BALLENY ISLAND, MUCH TO THE DELIGHT OF ISLAND HUNTERS. G1SWW WILL BE SPENDING 2 YEARS AT HALLEY BASE, STARTING FEBRUARY, 1991. HE WILL SIGN VP8SWW AND VP8HAL ON SSB. VP8GAV AND VP8FAR ARE AT FARADAY BASE. IA0PS WILL ACTIVATE TERRANOVA BAY AROUND FEBRUARY 15, WITH OPERATORS IK0AIH AND I0MAX KEEPING QSL MANAGER IK0GPP BUSY.

CROZET, FT8W. FT4WC HAS BEEN REPORTED ON 14027 KHZ AT 1300 UTC. QSL VIA F6GVH.

CHATHAM ISLAND, ZL7. HA9RE AND HA8XX WILL SIGN ZL0AAD/7 AND ZL0ADN/7 STARTING DECEMBER 11 FOR 2 WEEKS. QSL VIA DJ1ND.

IRAQ, YI. YI1BGD HAS BEEN VERY ACTIVE ON 10 METER SSB FROM 1300 UTC. ON7LX, DF3NZ, AND OE6EEG HAVE BEEN HELPFUL IN GETTING A YI QSL SINCE THE EMBARGO OF IRAQ INCLUDES MAIL.

KAMPUCHEA, XU. JG1RVN, WILL SIGN XU1DK FROM DECEMBER 3 TO 7. EMPHASIS WILL BE RTTY, CW, LF. IT IS NOT CLEAR IS THIS THE SAME OPERATION ANTICIPATED BY 9V1YC, DECEMBER 13 TO 20, OR AN INDEPENDENT EFFORT.

KURE ISLAND, KH7. KD7P/NH7 OPERATION IS ANTICIPATED FROM DECEMBER 12 TO 21. EMPHASIS WILL BE ON CW AND RTTY.

LESOTHO, 7P. ZS5WT AND ZS5BK WILL BE ACTIVE AS 7P8CW OR APPENDING /7P8 TO THEIR ZS CALL SIGNS FROM DECEMBER 13 TO 18. EXPECT PLENTY OF CW ON 40 AND 80 METERS.

MALAWI, 7Q. VINCE, 7Q7VP, LIKES 21240 KHZ AT 1930 UTC. QSL TO BOX 2111, BLANTYRE, MALAWI.

MALDIVE ISLAND, 8Q7. MIKE, K9AJ, ALONG WITH SUE, KA9RHK, WILL SIGN 8Q7BQ ON ALL BANDS, UNTIL DECEMBER 9. HE HOPES TO BE ACTIVE AS HS0AC DECEMBER 11 TO 14. QSL TO K9AJ.

MOROCCO, CN. N6AMG IS QRV UNTIL DECEMBER 7. HE IS WORKING THE WARC BANDS AND 6 METERS.

MOUNT ATHOS, SV/A. APOLLO, SV2ASP/A, IS A MONK WLL BE

OPERATING FROM MOUNT ATHOS FOR SOME TIME. HE LIKES 21335 KHZ AND HAS BEEN ACTIVE IN LIST OPERATIONS ON THAT FREQUENCY FOR THE PAST WEEK.

PENGUIN ISLANDS, ZS1. OH2BH, OH2RF, N7NG, AND ZS6BCR ARE ACTIVE AS ZS9Z/ZS1 THIS WEEKEND. CW, 24 KHZ UP FROM THGE. SSB, 45 KHZ UP FROM THEIR BAND EDGE. QSL VIA OH2BH.

REVILLA GIGEDO, XF4. XF4F LIKES 14030 KHZ AT 0200 UTC WHERE YOU CAN ARRANGE SKEDS FOR 10, 15 AND 20 METERS. QSL TO WA3HUP.

SAN FELIX, CE0X. THE XQ0X OPERATION HAS BEEN DELAYED. QSL MANAGER, CE3ESS, ESTIMATES ARRIVAL ON DECEMBER 6. THIS WILL BE AN ALL SSB OPERAON UTILIZING LISTS DUE TO THE LANGUAGE LIMITATIONS.

SOUTH SHETLAND ISLAND, VP8. THERE IS A GREAT DEAL OF ACTIVITY HERE IN ANTICIPATION OF THE ANTARCTIC SUMMER. SP5FYM WILL JOIN THE CREW AT HF0POL WHERE HE WILL QSL HIS RTTY OPERATIONS VIA SP3HLM. CE9GEW IS ANOTHER SOUTH SHETLAND OPERATION, OFTEN FOUND ON 14143 KHZ AT 2200 UTC WITH THE SOUTH AMERICAN DX NET.

SIX METERS. THE 50 MHZ BAND IS ALIVE THIS SEASON WITH ACTIVITY BY D68GA1Z, ZS9Z, 6W1BC, CN2JP, KD7P/NH7, KA3B/C6A, KP2A, 9L1US, Z23JO, AND NUMEROUS EUROPEAN STATIONS. AT TIMES, IT SOUNDS LIKE 10 METERS.

WALVIS BAY, ZS9. LLOYD AND IRIS COLVIN CURRENTLY ACTIVE AS W6KG/ZS9 . ON DECEMBER 3, THE PENGUIN ISTEAM WILL SIGN ZS9Z FOR 3 OR 4 DAYS. ZS9A CONTINUES HIS 10 METER ACTIVITY ON THE WEEKENDS.

NOTE 1. A LETTER TO W1AW, FROM DOC, W9NSN STATED HE HAS COMPLETED THOUSANDS OF CONTACTS QSL VIA HIS CALLBOOK ADDRESS AS IT HAS BEEN CORRECT FOR MANY YEARS.

NOTE 2. ALSO, A LETTER FROM CARINE, ON7LX, STATES LOGS FOR 9K2KS ARE IN HAND UP TO APRIL 21, 1990. NO LOGS FOR THE 9K25KS OPERATION. ALSO HAS THE LOGS FROM SAMY, YI1BGD, UP TO THE END OF FEBRUARY, 1990. ON7LX HAS A NEW POST OFFI THE NEW NUMBER IS 8210 INSTEAD OF 8021 LOPPEM.

NOTE 3. KC4MJ IS NOT THE QSL MANAGER FOR PA3CXC/ST0.

NOTE 4. 6FXBCS IS VE7DP OPERATING FROM MAGDALENA ISLAND, MEXICO.

NOT5. 5N0MRD OPERATES FROM THE GERMAN EMBASSY IN LAGOS. SINCE HIS QSL REQUESTS ARE REGARDED AS OFFICIAL MAIL, HE HAS BEEN RETURNING IRCS AND GREENSTAMPS RECEIVED WITH HIS MAIL.

GOOD LUCK ON DX DE KB8NW/OBS

SPECIAL BULLETIN 14 ARLX014
FROM ARRL HEADQUARTERS
NEWINGTON CT DECEMBER 1, 1990
TO ALL RADIO AMATEURS

ACCORDING TO THE LATEST INFORMATION FROM THE JOHNSON SPACE CENTER, THE LAUNCH DATE AND TIME FOR THE STS-35 ASTRO-1 MISSION WILL BE SUNDAY MORNING, DECEMBER 2, 1990 AT 0638 UTC OR 0138 EST.

TO MINIMIZE INTERFERENCE WHEN TRYING TO WORK THE SHUTTLE, PLEASE DON'T TRANSMIT, PARTICULARLY ON 144.95 MHZ, UNTIL THE SHUTTLE IS IN RANGE OF YOUR LOCATION.

LISTEN TO THE GODDARD AMATEUR RADIO CLUB STATION, WA3NAN, FOR LIVE LAUNCH COVERAGE ON 3860, 7185 AND 14295 KHZ.

After I converted my Cybernet board (Hy-Gain) to 10-meter FM, I converted it to scan all 10 cordless phone frequencies (46 MHz), with the PLL codes for each phone channel stored in an EPROM.

I have no doubt that a similar conversion could be performed to enable operation on 6 meter FM.

73, de John, KD2BD

There is a full-page ALINCO ad in Dec QST which claims that their 2M/440 dual band transceiver (DR-590T) has DTMF remote control capability as well as crossband repeater function. This sounded interesting to me --- put a transceiver on a mountaintop, use an HT on 440, crossband repeat onto 2meters.

I called Alinco and got the following disappointing story. Almost everything can be controlled remotely including power level, crossband repeat on/off, frequency and memory recall. The bad news is that the transmit offset cannot be selected.

(I never did get an answer to whether the rig automatically
chose offset on 2M. The guy said that "most repeaters in
the US have - offset.")

The Alinco guy's suggestion was to use the Memories instead.
(i.e. have all your favorite repeater freq's stored in memory
which does remember offset.) Only problem there is that the
memories can be selected only using "next memory up" and "next
memory down" control functions. There apparently is no "go to
a particular memory" function. This is OK until you forget
where you are.

I found it hard to believe that they had such robust functionality
but left out some critical features.

Can anyone confirm or deny what I've stated? Anyone have this
radio?

SpaceNews

MONDAY DECEMBER 3, 1990

SpaceNews originates at KD2BD in Wall Township, New Jersey, United States. It is published every week and is made available for unlimited distribution.

* MINI-TUTORIAL *

Keplerian data is widely used in the analysis of satellite orbits and the development of satellite tracking data for groundstations. These elements define the position and motion of a satellite in orbit around a larger body.

The first person to investigate elliptical orbits thoroughly was the mathematician and astronomer Kepler. He formulated a set of rules for elliptical orbits and was able to demonstrate that all planets followed such orbits in their motions around the sun. Over 100 years later, orbital elements defined by Kepler are still being used by astronomers and satellite trackers worldwide.

Radio amateurs use a sub-set of Keplerian data that usually includes: Reference Epoch Time, Inclination of orbit, Right Ascension At Ascending Node, Eccentricity, Argument of Perigee, Mean Anomaly, Mean Motion (sometimes replaced by Semi-Major Axis), Decay Rate, and orbit number.

REFERENCE EPOCH: (YYDDD.XXXXXXXX)

This is the precise time that the other time dependent elements are referred to. The format consists of a two-digit year number followed by a three digit day number, indicating the number of days since 01-Jan (day 0), and then the fraction of the day, which represents the hours, minutes and seconds, where one day equals 24 hours (one solar day).

Example: 03-Dec-90 12:30:15 UTC

03-Dec-90 = Year 90, day 337

```
12 Hours   = 24/12    = 0.500000000
30 Minutes = 30/1440  = 0.020833333  add to 0.521006944
15 Seconds = 15/86400 = 0.000173611
```

Therefore, 03-Dec-90 12:30:15 UTC = 90337.521006944

INCLINATION: (XXX.XXXX degrees)

This is the angle between the satellite orbital plane and the Earth's equatorial plane. A satellite with an inclination of zero degrees orbits exactly over the equator, while one with an inclination of 90 degrees orbits exactly over the poles.

RIGHT ASCENSION AT ASCENDING NODE: (XXX.XXXX degrees)

The right ascension at which the satellite crosses the Earth's equatoral plane going from south to north. Right ascension has traditionally been defined as the "first point" in the constellation Aries.

ECCENTRICITY: (0..1)

A dimensionless term used to describe the "flatness" of the elliptical orbit. A circle has an eccentricity of zero. A line has an eccentricity of 1. The orbit of OSCAR-13 has an eccentricity of about 0.7.

ARGUMENT OF PERIGEE: (XXX.XXXX degrees)

The angle between the line from the Earth's center to the satellite's point of lowest altitude (perigee) and the line from the Earth's center to the point where the orbit crosses the equatorial plane, going north.

MEAN ANOMALY: (XXX.XXXX degrees)

The angle which specifies the position of a satellite in its orbit, measured from perigee.

MEAN MOTION: (XX.XXXXXXXX perigees per day)

This is the number of perigee crossings the satellite makes in exactly one solar day (24 hours).

The semi-major axis of ellipse can also be calculated from mean motion using:

SMA (km) = 331.25 * (1440/MM)^(2/3)

Some satellite tracking programs use SMA as a replacement for mean motion. The quantity (1440/MM) yields the anomalistic period of the satellite (in minutes between perigees).

DECAY RATE: (+/- 0.XXXXXXXX perigees per day per day)

This is the first time derivative of mean motion and specifies the rate at which the mean motion is changing. A positive decay rate indicates the satellite is falling (speeding up). Decay rate gives an indication of the extent of atmospheric drag on the satellite.

ORBIT NUMBER: (XXXXX)

The number of perigees the satellite has experienced at the reference epoch.

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

As a service to the satellite user community, the following description of the NASA Prediction Bulletin's two-line orbital element set format is uploaded to sci.space on a monthly basis. The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

==

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNNN
```

Line 1 is a eleven-character name.

Lines 2 and 3 are the standard Two-Line Orbital Element Set Format identical to that used by NASA and NORAD. The format description is:

Line 2

Column	Description
01-01	Line Number of Element Data
03-07	Satellite Number
10-11	International Designator (Last two digits of launch year)
12-14	International Designator (Launch number of the year)
15-17	International Designator (Piece of launch)
19-20	Epoch Year (Last two digits of year)
21-32	Epoch (Julian Day and fractional portion of the day)
34-43	First Time Derivative of the Mean Motion or Ballistic Coefficient (Depending on ephemeris type)
45-52	Second Time Derivative of Mean Motion (decimal point assumed; blank if N/A)
54-61	BSTAR drag term if GP4 general perturbation theory was used.

	Otherwise, radiation pressure coefficient. (Decimal point assumed)
63-63	Ephemeris type
65-68	Element number
69-69	Check Sum (Modulo 10) (Letters, blanks, periods = 0; minus sign = 1; plus sign = 2)

Line 3

Column	Description
01-01	Line Number of Element Data
03-07	Satellite Number
09-16	Inclination [Degrees]
18-25	Right Ascension of the Ascending Node [Degrees]
27-33	Eccentricity (decimal point assumed)
35-42	Argument of Perigee [Degrees]
44-51	Mean Anomaly [Degrees]
53-63	Mean Motion [Revs per day]
64-68	Revolution number at epoch [Revs]
69-69	Check Sum (Modulo 10)

All other columns are blank or fixed.

Example:

```
NOAA 6
1 11416U          86 50.28438588 0.00000140           67960-4 0  5293
2 11416  98.5105  69.3305 0012788  63.2828 296.9658 14.24899292346978
```

Note that the International Designator fields are usually blank, as issued in the NASA Prediction Bulletins.

>from work and do some packet radio on company time.
>

I would feel nervous doing this unless I had something between the packet rig and the phone modem to make sure it was _me_ calling up. Something like, say, a _computer_. Hey, wait a second! I already have a computer hooked to both the phone modem and the packet setup. Now all I would need to do, is to write a program that answers the phone when it rings, accepts a password, and then connects the two com ports together, echoing characters from the one to the other, until it saw some really off-the-wall escape sequence. Then my program would hang up the phone. Or has someone already invented this wheel?

- Jerry Kaidor, KF6VB

I've had a Radio Shack Coco II running OS9 (a mini-Un*x) with a modem on one port and the TNC on another. I'd dial to the computer at home from work and connect to the TNC with a terminal emulator program to play packet. It was great fun to run a QSO with a friend in Montana from Fort Collins via the 145.01 NetRom nodes while at work. The packet speed was just right for still getting real work done - a sentence came through every 5 or 10 minutes. If my boss ever came by - I'd just iconize the window the session was running in.

OS9 has a simple password scheme so there was enough protection to keep out anyone but a dedicated hacker.

I know of other folks locally that have done the TNC to Modem connection. Not quite as secure but definately workable.

I don't know about the postal regulations, but the bigger cards are
(to put it politely), a pain. If you're using the plastic wall hangers,
they just don't fit.

It's not a big deal - just kinda frustrating when a person likes to display
all the cards in order received.

John,

I, too have been shopping for HT's, and like the TH-77A and FT-470. I haven't
gotten to play with a TH-77A yet, but I've been borrowing an FT-470 for
3 weeks now, and here's my comments:

   Good: * Easy to use keyboard, easy to read display, all the standard
             features, including PL encode, out-of-band receive, etc.
             (ICOM charges $45 more for PL encode :-(.
           * Perfect size case and perfect size buttons. The ICOM's are

either too big or too small.
* Lit buttons
* Nice sounding speaker and microphone (I've listened to others transmitting with the 470.)
* Good scanning modes
* Knobs on top of the unit are easy to access and turn.

Bad:
* Image rejection/intermod - Pagers frequently screw up the ham bands.
* Poor sensitivity out-of-band (I've actually measured this as well as experienced it. The weather station at 162.55 comes in much weaker than on an ICOM-2GAT).
* Doesn't have 15KHz step. This turned out to not be as big a deal as I thought it would be, but it would be nice if it had it. It does have 5Kz, 12.5Kz, etc. steps, just not 15KHz.
* Out-of-band range is MUCH smaller than that of the ICOM-24AT or TH-77A (with mods).

Other comments: Whatever you do, get a better antenna than a rubber duck. I use a Diamond RH-77, which works very well.

>There is a major glitch with the TH-77 with its memories. If you let
>the battery die down with the radio turned on, you will lose all
>memories and the radio will reset. Removing the battery pack with the
>radio on does not affect this, only letting the battery pack die. Terrible
>engineering flaw...

I've had this happen twice to me, too. I have APO and batt. saver on (the

defaults). But it doesn't always happen after the battery dies. I will
try remember to just remove the pack if I suspect the battery died, rather
than play with the power on switch. I have a suspicion that leaving the
power switch alone may be the way to have the memories survive a dead battery.
Can anyone confirm or prove this theory erroneous?

Yes, the ARRL Handbook shows the Morse characters for Japanese, Korean,
Arabic, Hebrew, Russian (Cyrillic), and Greek. Also some special characters
added to the usual international set for certain European languages
and for Esperanto.

If you don't have access to the Handbook, perhaps someone can suggest
another source.

Derek, can you please explain to us how you know that the person
calling is english-speaking?  I find it impossible to distinguish
english cw sending from non-english cw sending, so I would really
appreciate knowing the secret.  I wouldn't want to address an
english-speaking ham as a non-english speaker, or do the reverse.  I'm
sure you don't want to perpetuate the idea that only english speakers
can be radio hams, or do you?

Had a good time with the Usenet Un-Net this morning, though I must say that it seems to be primarily an East Coast phenomenon. I could barely hear the stations and they could not hear me, except for one intermediate station who was kind enough to relay my check-in (and got my call wrong - it's KC6OJW, not KB6).

One confused person from Tabago checked in by accident. 10 meters was definitely open this morning.

Check in and check it out. 28.390 or 28.410, depending on QRM, Saturdays 1700-1900Z. Be there...or be somewhere else.

```

FYI,

Before you buy that product, you might be interested
in a conversation that a good friend of mine had with
the Pres. of that company abt 1 mth ago. You know who "the company"
is.

My friend was concerned over the lack of interest that "the company"
had in correcting bugs and improving operation of their
products. The rpt group in question has several of "the company"'s
products. (85, 850, DVR, full remote base, FC-1, packet I/F)

They have had several occurences of "the company" bug fixes introducing
new bugs & problems with the other "the company" products. There are
also known problems that will cause the products to "lock up"
when certain operations are tried. (Legimate commands)

When asked abt the problems & bugs, the pres responded with
market-speak that the DVR & remote base users were such a
small percentage of their business that they were not going
to invest the time to correct them. When pressed on the issue,
he responded that the entire ham market was a small percentage
of what they do, and was difficult to deal with. When asked
again abt the bugs, he basically stated that the answer was no.

When asked abt why they were still advertising & selling
products knowing they were not going to support/enhance them,
the pres seemed to lose his temper. (Brings to mind some
"the company" ads..)

My friend walked away with several observations:

1) "the company" is losing/has lost interest in the ham mkt.
   (Despite their ads & hamfest efforts)

2) That despite what they say, their accessory products are supported at a reduced level. (Less users=Less support)

3) Operating a complete "the company" system becomes very difficult.

4) The quality of "the company" firmware upgrade does not seem to be fully tested.

5) Of the controllers available, "the company" is the least interested in "enhancement-requests". They are "use it they way it is, or go somewhere else" in this respect.

6) Future purchases of "the company" products are doubtful.

They mainly bought the "the company" system because because they were the only ones offering a "complete" system. Since the "system" is full of holes, they are not "happy campers".

There are other products that are engineered better, but do not have as many bells & whistles. They have been buying them for new projects.

So, knowing that I was not there, and this is second hand, give me a call if you want to speak with the person who *was* there.

I guess to prevent the "the company" lawyers from putting me in the poorhouse, I will state:

> That the events described above are anecdotal (sp?)
> and are strictly hearsay.

However, call me if you want to talk 1st person to the guy who was there.

caveat emptor!

I lied. It's "yee@ames.arc.nasa.gov", as above.

This talk about other alphabets in "morse" code got me wondering how the Chinese would do a code. Assuming that they don't use ASCII or other alphabets. Imagine that the guy who invented the concept of Morse code was Chinese and had enough technology available. What would he have done?

Is there a similar handle by which to address a YL. I've never heard YL used in the first person, and it seems rather offensive anyway.

Anyway, what do you guys :-) think is a good thing to put in the blank in:

GE ___ ES TNX FER THE CALL.

I don't really think you need anything. I think it's perfectly OK to send "GE es tnx fer call, ur RST .... (etc.)" on the first over, the other person can then address you by name on the next over, and you can do the same the next time around too. When you think about it, it's pretty artificial to address someone by their first name within seconds of meeting them, when they are perhaps halfway round the world and you may never run into them again. I do it, I think it's friendly, but it's still somewhat artificial.

I have occasionally had someone (non-U.S.) ask whether I am a "YL or OM", I usually don't even think about the gender of the invisible person at the other end of the QSO. I did hear an amusing exchange between a U.S. op and a Chinese ham recently, in which the BY said "name is Gu/YL", meaning her name is Gu and she's a female. This seemed to confuse the US ham, who had to ask for a repeat, and for the rest of the QSO sent things like "tnx for the QSO, Gu/YL...", I suppose Chinese names are confusing anyway....

>I'll take that seriously after they get rid of the non-ham taxicabs, truckers, boaters, and balloonists...

Yeah, I tend to agree. I suppose they are just as concerned about detecting and tracking the potential criminal use of the telephone. Face it, for almost any real application (criminal or legal) the phone (conventional or cellular) is a heckuva lot more practical than amateur radio will ever be.

I still wonder if the third-party rules aren't really intended to ensure the continuing uselessness of amateur radio to society at large, all the better to cause it to die more quickly so its frequencies can be given to other services.

I'm not saying that amateur radio should go commercial. Its prime functions of volunteer communications and technical development should remain unchanged. But strict rules based on the premise that even the isolated semi-business use of amateur radio is so horrible that each and every non-amateur message has to be manually censored before it can enter amateur frequencies have destroyed most of the opportunities for synergistic cooperation between amateur and non-amateur networks. And that's a shame.

As a side benefit, it also assists safety conscious drivers to pinpoint those portions of the Interstate that are considered by knowledgeable authorities to be fraught with hazard as a consequence of the large number of motorists driving without due regard for safety. :)

I often drive from Fort Collins to visit relatives in Montana via Wyoming. On those nights, when both Wyoming hams are asleep, it's a pleasure to visit with the truckers on ch19. Unfortunately, often there aren't even any trucks in range.

Below is the SAREX operating schedule with dates and times given in UTC and adjusted for actual STS-35 launch time. The basic data for this schedule comes from "STS-35 SAREX Shuttle Amateur Radio Experiment Information Summary" as distributed on rec.ham-radio by N5WQC/W5RRR on 29 November.

The first three columns give Mission Elapsed Time (MET) in Days, Hours, and Minutes. The next three columns give the same time in Universal Coordinated Time (UTC) in Day of the Month, Hours, and Minutes. The final column identifies the nature of the event to occur at that time.

Be careful when using these UTC times that you are really thinking in UTC and not in your local time. Remember for example that Tuesday December 4 01:30

UTC is Monday night December 3 20:30 EST, 19:30 CST, 18:30 MST, or 17:30 PST.

Good luck and happy Shuttle DX'ing.

Official launch time is 2 December, 1990, 01:49:01.07 UTC

```

This is yet another ham tradition, and a harmless one. It emphasizes that all hams, whatever else they may be, belong to the (what's the non-gender-specific equivalent to "fraternity"? I think "frarority" is an abomination.) of hams. While I may not consider addressing JY1 as anything but "your highness" in a normal social context, when it's one ham to another, Hussein is appropriate...and, I understand, what he expects.

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

In article <378@ka2qhd.UUCP> kd2bd@ka2qhd.UUCP (John Magliacane) writes an otherwise excellent tutorial on Keplerian orbital elements. However, there are a few minor errors.
>ECCENTRICITY: (0..1)
>
>A dimensionless term used to describe the "flatness" of the elliptical orbit.
>A circle has an eccentricity of zero. A line has an eccentricity of 1.
>The orbit of OSCAR-13 has an eccentricity of about 0.7.

Actually, a parabola has an eccentricity of 1. A line has an eccentricity of infinity. Orbits with eccentricities between 1 and infinity are hyperbolae. (The Voyager 1/2 and Pioneer 10/11 spacecraft are in hyperbolic orbits with respect to the sun, i.e., they're on solar system escape trajectories.)

>ARGUMENT OF PERIGEE: (XXX.XXXX degrees)
>
>The angle between the line from the Earth's center to the satellite's point
>of lowest altitude (perigee) and the line from the Earth's center to the
>point where the orbit crosses the equatorial plane, going north.

The angle should be measured the opposite way (i.e., from the ascending node to the perigee point, not the other way around). Also, the angle is measured in the orbit plane.

>MEAN ANOMALY: (XXX.XXXX degrees)
>
>The angle which specifies the position of a satellite in its orbit, measured
>from perigee.

No. This is "true anomaly". Mean anomaly is a somewhat artificial value; it's actually a measure of TIME since perigee, with that time value scaled so that 360 degrees represents one orbital period. Mean and true anomaly coincide only at perigee (0) and apogee (180) except in the case of a perfectly circular orbit, in which case they are always the same.

>Some satellite tracking programs use SMA as a replacement for mean motion.
>The quantity (1440/MM) yields the anomalistic period of the satellite (in
>minutes between perigees).

Note that this is not recommended practice. Small errors in computed SMA result in bounded errors in computed distance to the satellite (which most hams don't care about, except for those doing ranging) while small errors in computed mean motion can result in unbounded errors in satellite position along the orbit as time increases. Therefore it's better to use mean moton as input to the program and have it compute SMA internally rather than the other way around.

>ORBIT NUMBER: (XXXXX)
>
>The number of perigees the satellite has experienced at the reference epoch.

This figure has probably caused more confusion in the amateur community than any other, mainly because the figures included in the NORAD/NASA bulletins are so often wrong. Some agencies count orbits as ascending nodes (south-to-north equator crossings), others count them as perigee passings, and because of continuous changes in the argument of perigee caused by orbital perturbations (chiefly the earth's equatorial bulge) these number diverge after some time in orbit.

Phil

OOPS!

The official launch time for STS-35 and the Sarex mission that I gave in the posting this morning is not UTC as claimed, but EST. The CORRECT UTC launch time is 2 December, 1990, 06:49:01.07. The times given in the sarex operating schedule list correctly give UTC as indicated.

Trying to do these things at 04:00 hours local time does have a price!

My apologies for any inconvenience this error may have caused.

This rather simple idea is proposed for perhaps two types of groups..... ..those who have become a little bored with their ordinary SSB QSO's and schedules and are curious to try RTTY which is uncomplicated and VERY CHEAP to play around with, and perhaps a younger group who are necessarily limited to a low budget. The former group would include a large number of retired hams who have excellent transceivers, likely to have "buddies" that they frequently chat with, and have plenty of time during non-QRM hours, but also would enjoy the simplicity of this approach.

The idea is to simply utilize a low-cost 0 to 300 baud, ASCII modem and operate on 110-baud (standard Bell 103). It ordinarily uses two sets of tones... 1070, 1270 and 2025, 2225 Hz. We however, will only use 2025 (space) and 2225 (mark). Note that the "higher tone" is the "mark" which is opposite the usual ham-RTTY convention.

The modem (pair) that I recently used to check out the system was a VERY ATTRACTIVE BARGAIN in the two most recent issues of "RUN" Magazine which is a magazine for Commodore Owners. It is offering a close-out of Commodore Model 1660 0-300 baud modems for $10 plus $3.50 shipping. It is a high-quality modem that includes a 5 1/4" disk with two excellent "terminal programs". An excellent user's manual is also included. So this modem is especially attractive for Commodore-64, 128, or Vic-20 owners. The disk that comes with it will allow pre-recorded messages to be "up-loaded", i.e. automatically sent out over the air at 110-baud, and incoming messages, or QSO's can be captured in the computer memory and re-read, or printed out later if desired.

Also, of course, the simplest of "terminal programs" can be used if desired, and there are many public domain ones around, or a simple, short "basic language" program can be hand-typed in.

They say the supply is limited and can be ordered by phone (credit-card) at 1-800-343-0728, or by mail at: RUN Modem Offer, 80 Elm St, Peterborough, NH, 03458.

This modem has the convenient (for our purposes) manual switch to change from "Originate" mode to "Answer" mode....so our simple little trick is to Xmit in the "Ans" mode (which Xmits the 2025, 2225 Hz tones), but then when we switch to Rcv we must also switch the modem to "Originate" mode so that it will be receiving on the same 2025, 2225 tone-pair. The modem is just a little too "smart" for us as designed since it only turns on the Xmit tones when the computer takes it "Off-Hook". To avoid this complication, it can be forced to Xmit at all times in the "Ans" mode by prying off the plastic case....cut the conductor to pin "J" and ground the conductor that previously went to "J" (don't ground pin "J". If you don't have a diagram, pin "J" is across from pin 8 on the 24-pin connector. (All four end pins, 1,A,12,N are ground).

Although I don't think it's necessary, I also disabled the "Carrier Detect" line by cutting the conductor that went to pins H & K, and this time, pins H & K get grounded but not the conductor. (Pins H & K are directly next to pin "J" on opposite sides.....across from pins 7 & 9).

The conventional telephone connection (only the red & green wires are used) to the modem (USOCRJ11C) puts out a pure sine-wave of approx 500 mv P-P which is too much since we will be switching this into the microphone input during Xmit. I attenuated this about 20:1 with 10K/510 ohm divider network. This was a good level for my ICOM-751, and my friend's ICOM-725 . At this early stage, we used a small DPDT toggle switch to simultaneously key the Xmtter as the modem telephone line was transferred from the Rcvr audio out, to the Microphone input connection.....which requires that the Orig/Ans switch on the modem must also be switched manually. If we play with this scheme much longer we will probably extend wires out from the modem switch and have a second DPDT sw alongside the first one so that they can easily be switched together. In the Rcv mode, we did not use a gain pot....only a 2.2K series resistor was used to reduce the Rcv audio level into the modem. Actually, I used a small 600:600 ohm isolation xfmr between the modem phone-line and the transceiver DPDT switching, but I don't think it would be required.

TO THIS POINT, this would appear to be Commodore-computer oriented,
BUT THE FACT IS that my friend didn't have a Commodore. We both did have, however HAZELTINE 1500 computer-terminals. These and similar terminals are beginning to appear at reasonable prices.

This is already too long, so I won't mention the modification details that were done to the Haz-1500 except to say that it is quite easy and only 4 resistors, 1 transistor, 2 zeners, and 1 diode were used....all concentrated near the "AUX OUT" 25-pin connector which is seldom used and has about 20 unused pins... only two conductors were cut (related to the AUX OUT connector and probably never needed) and this included a "reversing" switch for RCV.

By the way, the modem gets it's power from the Commodore computer in the first case, and from the Haz-1500 in the second case (Modem basically will require + and - 5 volts).

I probably should remind some readers of some underlying factors in this experimetal proposal: first, I will confess I have only recently tinkered with any RTTY so may be naive on some things that may raise some eyebrows among the pro's
This is not intended to compete with the high-tech state-of-the-art with all it's error-correcting, auto-copy etc., but perhaps it might attract some who have not up until now ventured into RTTY.

This is ASCII, and practically all the ordinary, simpler QSO'S are on 45.45 baud Baudot with 170 Hz shift (ours is 200 Hz). I believe the bandwidth required for our 200 Hz, 110-baud is 200+(2 x 110)= 420 Hz, compared to 170+(2 x 45.45)=261 Hz. Note that conventional RTTY tones are 2125(mark) and 2295 (space). By the way, this system works at up thru 300-baud also.

As most are probably aware, this method of putting audio-shifted tones into the microphone input of an SSB transceiver, is just a trick way of imitating the conventional cw carrier-shift method (FSK). Assuming that sideband suppression and carrier-suppression is proper, the person receiving you will not be able to tell which method you are using. Remember, however, that your actual transmitted mark-carrier is 2.225 Khz higher (on USB), or 2.225 Khz lower (on LSB) than what your transceiver digital readout says. Thus if you wanted to invert your tones by changing sidebands, your dial readout would have to be shifted 4.450 Khz to keep your mark tone on the previous frequency. (This does not apply if you are talking to someone using this same experimental system).

To avoid all these considerations, I will probably later modify the modem further to include a couple of simple inverters and separate switches for either, or both Rcv & Xmit. Two sections of a CD-4007 CMOS operating on +5 volts seems like an easy solution....crudely included within the modem case.

By the way, the 1660-modem takes pos-logic data IN on pin "M" (across from pin "11") and sends OUT pos-logic level on pins "B,C" (across from pins 2 & 3).

+5 volts goes to pin"2", but you will have to patch-wire in your -5v to IC pin-4 of the LM-358 (IC-2). Alternatively, you can put approx -9v on the Neg-lead of C-4 which then goes thru a small pass-transistor which drops it to -5v. If the modem will never be plugged into a Commodore computer, you can steal pin "11" to send this Neg-voltage in.

If any group should adopt this "modem-type" approach....note that every thing works out perfectly....it's just as simple as getting on "voice SSB" on exactly the same frequency. With all the excellent transceivers in widespread use, there need be no frustration or tuning indicators required. The only need would be for users to sharpen up their skills in getting their transceiver precisely on frequency (there are neat tricks to to be able to calibrate to WWV and get on freq to within about 10 or 20 Hz. easily and quickly)...they should probably use a convention of always operating on a full Khz (no fractions) so that signals could be easily tuned in.

I haven't been able to find anyone on simple ASCII to check it out but I'm told that most conventional RTTY with 170 Hz filter-separation would most likely do a good job of copying a 200 Hz-shift signal. (Note that their rcvr only needs to be tuned slightly differently to accommodate the different tone-set.

Probably "RIT" feature would be used to reconcile any Xmt/rcv discrepancy.) Actually, probably a very large number of RTTY people have versatile enough equipment that DOES HAVE the capability of communicating on 110 baud ASCII...it just seems that most of them have been bound by convention. If you persist long enough calling CQ you will probably find someone curious enough to finally figure out your mode and switch over to make a QSO. (the later equipment does this for them automatically). I did this recently with some other 110-baud ASCII and finally did have someone get on the same mode and we had an excellent QSO.
(Perhaps if this new group develops, they could call their CQ's in a very deliberate "quirky rythmn" so that they could be easily identified.)

Incidentally, using our conventional 2.1 Khz SSB voice filters (No optional filters switched in), we can get absolutely perfect copy here in the midwest from W1AW when the band conditions are very good....both 40M & 20M.
(we get them on USB instead of the conventional LSB....presumeably because our mark-tone is the higher frequency (not the ham convention). Of course we could simply reverse our Rcv switch. W1AW sends plain ASCII at 110-baud, 170 Hz shift.
However if you have additional bandpass features, your transceiver can can enhance performance under more adverse conditions. My band-pass-tuning on the ICOM-751 becomes an excellent 800 Hz bandpass filter on either side-band. Also my optional 500 Hz CW filter is excellent.

As posted in QST Magazine, W1AW sends teleprinter bulletins 3 or 4 times a day using ASCII and 110 baud, but they are very short spans (perhaps 10 min).

Other brands of low-cost modems abound, no doubt, but you would have to figure out any changes required. I have in the past done a similar modification to some "Total Communication" package modems similar to this one but I will not prolong this posting any further.

I am having the same problem with him (on the same subject, BTW). It's that rinky dink ampr.org. Even addressing via the exact bangpath a message came in on won't work. They've got themselves a real alligator there.

The sad part is I have the exact answer to the question he's asking and can't get it to him.

I'm a pilot, in the Civil Air Patrol, and studying for the Novice and Technician class amateur licenses (to get me into 2m FM). I've been looking at the Kenwood TH-27A, because it receives aviation AM in addition to its 2m capabilities. I have a few questions you all may be able to answer:

* Compare and contrast its feature set, reliability, warranty, and user interface with the IC-2SAT, which I'm also considering. For example, the Kenwood has a separate AM circuit block, but the ICOM relies on its FM circuitry to decode the AM -- is this Good or Bad?

* Should I buy a different antenna for it? If so, which one?

* Who's currently offering this for the lowest price? HRO in Denver has it for $359.95, but allegedly matches anybody else's price.

* Has anybody figured out any mods on this radio (how I can enable it to

  xmit on CAP frequencies all by myself, can I connect it into an
  aircraft intercom, etc.)? I'm calling Kenwood this week to see if I
  can purchase a service manual -- will that include mods?

Email would be great, and I'll summarize.

As I understand it, the third party restrictions were put in at the insistence of foreign Post and Telegraph administrations. Communications is a government monopoly in many countries and they were afraid of competition cutting into their revenues. Many refused to support amateur radio at all unless the anticompetitive restrictions were included. The time has long past when amateur radio could make a significant impact on commercial telephone traffic, but we continue to be saddled with historical artifacts in our regulations. Write 100 times, I won't mention Morse. :-) Except for their obligation to uphold international agreements, the FCC couldn't care less about third party traffic. With the growing demand for VHF/UHF/SHF spectrum, and with the declining interest in HF by commercial interests, expect amateur radio to go the way of CB. Amateur radio may wind up relegated to the worthless "skip" bands and roundly ignored. This may make the DXers and pseudo-broadcasters happy, but experimenters will become nearly extinct. Pity we don't have the numbers to be a political force in the decisions that will shape our future.

Speaking as a retired police dispatcher, I can assure you that it is not uncommon for officers to "run radar" with the full knowledge and intent that tripping fuzzbusters will slow things down. Sometimes on holidays, this is the SOLE purpose.

Yes I was guilty of loose use of terms. With an antenna fed with a single type of feeder of low loss, the impedance seen at the feedpoint varies with feeder length but maintains a constant VSWR and return loss. On a Smith chare normalised for the feedline Z, the actual impedance moves around a circle centred on the centre of the chart. While changeing the length of your feeder vill not affect the value of your VSWR, it is a useful trick to allow you to avoid values of Z which may not be matchable with your specific ATU. ATU's cannot match all impedances at all frequencies and have zones where they are useless. Further, they have ranges of Z where their efficiency can be surprisingly low. Sometimes a change of feedline length can allow you to use your ATU more efficiently.

The original G5RV is a special case, The coax run was supposed to be of 75ohm cable, and the open feeder of 600ohm. By playing with the lengths of both parts of the feeder, the feed point VSWR can be affected. The reason is that we can move the endpoint inpedances around two circles; each on a differently normalised smith chart. However, this is very much a compromise trick used only in the original G5RV design. The commercially available antennas are similar, bur they tell you to use 50ohm coax.

If you can run the flat/open feeder into the shack and use a balanced ATU you'll find you can get away with murder :-)

Hope you're getting all the info you wanted :-)

I recently purchased an AEA AMT-1 interface. For those of you unfamiliar with this, it is a digital interface that does Amtor, RTTY, and sends CW. At least it claims to send CW.

Well, this brings me to my problem. The CW that it sends leaves nothing more than a character space between words. This makes reception of this abitofaproblem. :-)

I called AEA and they are less than interested in this situation since this is such an old product (not built after 1985). Of course I was willing to pay for an upgrade, if they had one, but they were not even certain that they had one. They said that the latest PROM should be marked "E1022". Mine is marked:

    AMT1 `82
    GPW ELEC
    V01

Now my question. Does anyone have a PROM for this old beast that works for sending CW? I have ordered a CW reception (daughter?) board from Burghardt, but they claim that this does not involve a firmware upgrade. Any clues? I can burn PROMs here if anyone has a PROM image that might be helpful.

[Since this was not engineered by AEA, I am opening this article up to world distribution (specifically the UK). The PC board lists a company "GPW ELECTRONICS, LTD" and the back of the case has an address of "I.C.S. ELECTRONICS, PO BOX 2 ARUNDEL, W. SUSSEX ENGLAND". Anyone know the genealogy of this product?]

>USSR? If so -- How many are they and how do you express them in CW?
>Any short-form (eg. OBL).

Certainly the ARRL-Handbook does contain the Cyrillic cw.It is surprising
just how easy it is to pick-up the cyrillic code,and certainly can give
the op at the other end a pleasant surprise too!It is interesting to note
that Soviets actually use the standard abbreviated English for many of the
shorter contacts with each other, I was once amused to hear a UA3 sending
'cheerio' to a UA9! Another surprise I had was when in the radio op's seats.
in an Aeroflot transport plane earlier this year(as a guest) I heard the
op when requesting the weather at tthe destination send 'pse wx' (yes , cw is
still used on Aeroflot transport flights in the Arctic as the major mode
of communication), and he couldn't speak a word of English.

Regarding 'oblasts',they are basically administritive regions in the USSR,
and there are something in the region of 180 of them, although they do
appear to keep changing which makes it a little difficult to keep track!
There is a full list of the oblasts in the ARRL Operating Manual, and it is
generally easy to tell in which oblast a station is by his call(number and
first letter of suffix).The abbreviated form oft he word commonly used is
OBL.,and in cw OBL is the same in both English and Cyrillic.The full word ,
oblast , would be sent as 'oblastx'.

Hope that's of use........

=======================

From: techpubs@PRC.Unisys.COM
Subject: RE: Antenna Matching

I have a friend who ran a setup very similar to what you describe for years. Brought the twin lead down the side of the house to the second floor (well under a 1/4 wave, probably under an 1/8 wave also in twin lead length), fed the twin lead in through two holes cut in the wood window footing through two porcelan feed throughs, and right to his transmatch (which probably had a built in balun). Always worked ok and never had any problems. I would avoid going to the ground and then runing up just to get a 1/4 wave feed length. Also, I think it probably advisable to keep the balun right at the transmitter location in this case. You should watch for high RF levels in the shack (eg, mike burn, rf feedback, etc), and avoid sharp bends with the twin lead.

=======================

From: halbert@crl.dec.com
Subject: RE: Antenna Matching

Here's some advice, for what it's worth.

The "drop perpendicularly away from the antenna for at least a quarter wavelength" is not so critical. The main point is that the feedline may couple to the antenna if it ends up parallel or approximately so to the antenna. This may or may not produce RF in the shack. It may just distort the antenna pattern, and you probably wouldn't notice that anyway. The feedline length will also have some effect on how easily the antenna tunes up, but that's not predictable.

At first, just try enough feedline to get to your tuner. If things seem hot with RF in the shack, splice in some more. As a last resort you could try sticking the extra length out the window in the "big drip loop" configuration you described.

Supposedly you shouldn't turn really sharp corners with open-wire. Don't pile it up on itself, of course. Also, you supposedly shouldn't run it near metal, but I've run it near (insulated by some plexiglass) metal window frames with 100W, and not had any problem. Currently I run 300 ohm from my shack into the attic, through a plastic Radio Shack thru-the-wall antenna coupler, through my aluminum siding (!), where it connects to 450 ohm line outside, and haven't had any trouble. I use ladder line outside instead of just 300 ohm twinlead, because twinlead is supposedly affected a lot by rain, snow, etc.

A balun isn't really necessary, and won't actually work very well if it's looking into some messy or high impedance. I have a horizontal full-wave 40m loop, and use a balun just after the tuner so it will tune up more easily, but a loop doesn't have such wild impedance swings on different frequencies as a dipole.

Basically, just try something; it's not critical.

Regards,
--Dan, KB1RT

From: sawyer@TWG.COM

Re your plan to put up a double Zepp...I would be interested in what kinds of feedback you receive to your posting. I have a double Zepp I put up for 160 and up which is 253 feet long and roughly 150 feet up at the feedpoint. It uses exactly the same feedline you are going to use. This thing runs from my tribander mast over a valley to a tree on the next ridge line. I just draped the feedline from the feedpoint through a catenary back to my shack, which is about 50 feet from the mast. Thus the feedline doesn't leave the Zepp at right angles at all--it's more like 60 degrees or so. I was careful to let the feedline have no sharp bends, and it goes straight to the transmatch when it comes into the house. I was also careful to keep it 6" away from any metal--like the gutters and the door frame. It works great on all bands. There are times it even beats my tribander on 20/15/10 (a HyGain Explorer 14). However, if you pick up something via the net that would show me how to improve it even more, I'd sure be interested. Thanks in advance.

Bruce Sawyer
sawyer@TWG.COM   a.k.a. AA6KX

From: DERRY@ROSEVC.Rose-Hulman.Edu
Subject: Zepp (pedeedoodah)

Steve, You are describing MY antenna. It's 35 feet in the air and is 131 feet long. I use it on all bands from 160 (fed as a Marconi antenna) up to 6 meters.

Don't get too uptight about all the restraints. My feedline (it's 300 Ohm foam TV twinlead) angles from the center of the Zepp over to my house wall where I have a nail and some nylon cord. Then it runs along the wall for a few feet then in through the 2 x 6 to a crawlspace. Its then runs through the crawl space through another 2 x 6 into my basement, where the shack is.

You're on the second floor. So just run the feedline as directly as possible to your shack. Don't make bends so short it will kink it. It's ok for it to run near metallic objects but don't let it lay to close to any such object for any significant distance.

My advice is run the feedline like it was coax to the transmatch. Then using plastic tape, string and thumbtacks, kind of dress it away from any long runs near metal stuff. Near means 4 or 5 inches for the type of transmission line you are using.

I once had all the questions you have running through my head, then I worked a guy on 40 m using "our" antenna. I raised the same questions as you have in your query. He said, "Don't worry about it."

There is nothing important about having 1/4 wavelength of line. Shorter is better. You may find some bands where your tuner is kind of hinky. But eventually you'll find the right settings for each band. I use a MFJ-941.

Incidentally, if it's resonant on 7.1 MHz, then its other resonant frequencies are: 14.2, 21.3, and 28.4 MHz.

I made mine 131.8 feet long. It's resonant at: 3.55, 7.1, 10.65, 14.2, 17.75, 21.3, 24.85, and 28.4 MHz. In or very near all the hf bands. But 132 feet is a bunch.

The G5RV is an antenna for folks who don't really believe in the center fed Zepp. I don't think you need it. Read about it in the ARRL ant-compendium. It requires 30 feet of parallel wire line then 68 feet of coax. I can't figure out why the 68 feet, not has anyone been able to explain it to me.

If you're really in a bind about running the twin lead through walls etc, ARRL Antenna Book suggests TWO pieces of coax from the Transmatch to the point where the twin lead is in the clear. At the Transmatch use each center conductor as parallel line and ground both shields. But where you connect the twin lead to the coax, DO NOT GROUND THE SHIELDS.

This is a neat trick, but in my setup I've never had to use it.

Let me know how this works out. I'll listen for you on 40 m. I'm on quite a lot.

Traditionally, the first Electronics Flea Market of the year is in March. Being an outdoor event, the partipants take their chances on the weather.

For the benefit of those who may not be familiar with this event, a group of Amateur Radio Clubs in the region south of San Francisco conduct a flea market in the parking lot of Foothill Jr. College in Los Altos Hills the second Saturday of each month during the spring and summer. Admission is free buyers. Sellers pay something like $10. Of course, if you find a "bargain", you might spend more! Come early! Most of the sellers are packed up by noon.

>Having only used coax feed for 33 years, I thought it was time to learn
>balanced line.
>

It is a G5RV. I'm using one of them, and I'm extremely happy with it. It is about 12 feet off the ground (barely clears the ridge of my roof), and the down-feed goes down about 2 feet, then follows the roof contour until it drops over the edge. Then it runs horizontal for about 4 feet before it goes into the "black box". My co-ax runs about 10 feet from there to my rig.

There is a dog-leg of about 15 degrees at the center insulator because I anchor it at the chimney while the ends run to two trees. I always get good reports using this set-up, and some think I'm kidding when I tell them about it. Don't ask me how it works as well as it does. It seems to defy every antenna theory.

I have a tuner, but rarely use it. It works just as well without it. Of course, I'm running a tough old Heathkit SB-102; I might be more particular if my rig was one of the "modern" ones that need a low SWR.

Anyway, that's for what its worth.

In response to the request for help in explaining some problems I was having in building a phased vertical array for 40 meters, I have received quite a large number of responses. It's amazing to me how many talented and knowledgable there are who obviously follow this group and will respond via email but have the good sense to stay out of some of the unresolvable debates. At any rate, the response I got was so great that I can see there's widespread interest in this topic. Hence this note is offered as something of an update on the topic and a consolidation of some of the suggestions I received.

First of all, I followed some of the initial advice I received and went back and retuned each of the two verticals to be resonant at the design frequency. Each was tuned in isolation of the other on a single 50 ohm cable. Next, I built a new phasing harness consisting of one 0.25 wavelength section and one 0.5 wavelength section of RG/11: 75 ohm stuff. I know that using multiple quarter-wave sections of 75 ohm cable will transform a 50 ohm load to a 100 ohm load. The two 100 ohm loads in parallel at the "T" connector then present 50 ohms to the feedline back to the transmitter. Without a good antenna noise bridge I'll never know for sure, but at least this brought the SWR down to around 1.25. Furthermore, it dipped in the vicinity of my design frequency (7025), so I treated this as absolutely good enough.

During actual use, it did show considerable gain in the general direction I wanted, but with some new anomalies. I have a second antenna I can use on 40 (a double Zepp cut for 160 and up) that provided a good reference point, since the broad side of the Zepp is in the target direction of the phased vertical array. The thing was absolute dynamite in the target direction--at least a full S unit, maybe more. What was curious was that the maximum gain seemed to be off counterclockwise (looking down) from the axis along the two verticals. It turned out to be a rotten idea for a contest: it put out a great signal to Japan (304 degrees from here), but was really poor toward Europe(at 25 degrees). Never again will I try to use a directional antenna I can't turn in a worldwide contest.

In the comments I received back, opinion seemed evenly divided between people (who seemed to me to be knowledgable sources) about whether the harness should be built from 50 ohm or 75 ohm cable. I used 75 and it worked, but there sure were a lot of people who said to use 50. (I once built a 2 meter array using 50 ohm cable, and it did fine.) Next, the point was made to me repeatedly about the effects of the mutual impedences of the two verticals. Common opinion was that the system needs to be tuned with an RF ammeter at the base of each to insure that each gets an equal current flow when connected in the phased array. Also suggested was using an antenna noise bridge at the base of each to get the feedpoint impedences the same when connected in the array. Tuning is accomplished by adjusting the lengths of the delay lines (notice how easy it is to say that, as opposed to actually doing it?) Several people made the point that simply cutting the delay lines to the theoretical lengths will not result in a 90 degree phase shift. DL6RAI wrote to say that he had actually measured it at 70 degrees in one he had built this way. That computes with my experience of having the direction of maximum gain offset from what I expected. However, I'm at a loss to explain how you (a) tune the lengths to get equal impedances (or current flows); and (b) get a real 90 degree phase shift.

In summary, what came through is that the popular literature does a real disservice to this topic by oversimplifying it. It is, I'm sure, well understood in the broadcast industry. But too much has been deleted in translating this into the popular ham literature. For reference, I have been directed to Terman's "Radio Engineer's Handbook" and a 6 part series in Ham Radio Magazine circa 1983.

Hope this helps those interested in the topic. And many thanks to all who sent their suggestions.

Anyone ever transvert a CB radio to operate in the AM portion of the 6M band? Easy/hard to do? worth the effort? BTW, how does one do such a thing? Is a transverter more than essentially a heterodyne stage that operates at high power?

Of course, you'd need to filter out the 27Mhz from the CB, and the 24?Mhz local osc from getting out on the air. That shouldn't be too hard.

BTW, does anyone know how to make the rn program stop asking me if I want to add new newsgroups? About once a week, the program makes me say "no" to something like a hundred groups. one at a time. *VERY ANNOYING!!!*
I consider this an annoying bug in this program. Or if it insists asking me, at least give me a menu to pick from, or say one "NO" to them all. NOT lots of NOs!

After using the Loop some more, it appears to be an outstanding low-band antenna, compared to my HF6VX on the ground. The Loop seems to get 1 or 2 more S-units, and the audio is perceptably louder (the "audio test" is the proof of any antenna :).

This might be due to my not having an adequate groundplane for the lower bands - 32 radials ranging from 15-30' each, all property-limited. The groundplane is near perfect for 10/15/20. The HF6VX is a 1/2-wave on 20, 1/4-wave(?) on 15, Awfully Darn Long on 10, so it has gain over a simple 1/4 wave trap vertical.

Compared to the work of laying all those radials, the Loop Skywire is several orders of magnitude easier to install.

> The book says the wire should "drop" at least a quarter wavelength ...

The situation the book writers had in mind was an antenna high in the air. I would think it best to bring the feed wire at right angles to the antenna, but at an angle to the height of the radio room. It would be very convenient, if "right angles" happened to line up with the window!

The question was also raised about metal objects near the feedline. Old rules of thumb suggest maintaining a spacing several times the distance between the wires. Crossing a metal window frame at right angles is not as much a problem as running parallel to a metal object.

Caravaning is one of the best applications for 2-way communication. The biggest advantage of CB is that everyone can use it. The biggest disadvantage is that everyone can use it, like the multi-kilowatters near the Gulf of Mexico. Hello, Skipland, as it were.

Three other hams and I drove three separate vehicles to Lake Powell, some 12 hours from here. I had never been there before. In spite of leaving at different times, we all arrived at the appointed time and general vicinity, and were able to use 2m to coordinate finding each other and loading the week's provisions. It worked so well, Murphy never had a chance.

>It also says that the feed line should drop
>perpendicularly away from the antenna for at least a quarter wavelength. My
>question is what to do with it after that.

The intent here is to keep common-mode RF off the feedline. Since your transmitter is going to be in the antenna's field in a major way, I don't think you can avoid it. It might be better from a safety standpoint to move the shack down to the first floor.

>There is a well-advertised commercial antenna (is
>it a G5RB dipole or something like that?) that drops balanced line for quite a
>way into a "black box" with coax out. What sort of a balun is that?

I think it just connects the line to the coax. The G5RV has some interesting matching problems, since some of the harmonics are end-fed half-waves out of phase, which have K-ohm impedances. All the G5RV designs I've seen don't use baluns.

>Never
>having used balanced line before, I'm a little uncertain of what I can do with

I've used this stuff, and the rule appears to be "Keep it away from long runs of metal parallel to the line."

The volunteer examiners don't get a nickel. At least at sessions I have
attended, every penny of the $4.75 (or whatever it's up to now) goes
to the Volunteer Exam Coordinator (in our case, ARRL-VEC). We never even
get our hands on the money, since the check is made out to the VEC.
In fact, we have to cover our own miscellaneous expenses, for which we
are reimbursed by our local ham club.

Examinees are getting a very good deal, both financially and from the
standpoint of availability of test sessions, compared to the "bad old
days" when the job was done by the FCC.

I have used a 144 MHz Isopole successfully. I "believe in it" much more than ground plane-less antennas such as the Ringo Ranger, but have no experimental data to back this up.

If you are referring to 2m repeaters, the 146.97 machine in Colorado Springs is at 14,110 - Pikes Peak. I think that there is a machine (6.94) on Mt. Evans near Denver, also. (approximately 8-9K feet above nearby cities).

>typical. My antenna is a homemade 'active' whip which is about 10
>feet long. I was told that NDB's are low power in order to minimize
>interference between beacons operating on the same frequency in
>different geographical locations.

The output power of NDBs vary widely. NDBs are divided into four classes:
1) HH - high power homing beacon, over 2 KW. These have a designated service radius of 75 nautical miles at all altitudes.
2) H - medium power homing beacon, between 50 watts and 2 KW. 50 NM.
3) MH - low power homing beacon, less than 50 watts. 25 NM.
4) LOM/LMM - compass locator beacon. These are located at the outer marker (LOM) or middle marker (LMM - these are rare) of an Instrument Landing System. LOMs and LMMs have a service radius of 15 NM, though their power output isn't specified in my reference.

Unfortunately, the only way to find out what class a given NDB is in is to figure out where it is, and then look it up in the Airport/Facility Directory for your area, available for $3 (I think) at your friendly neighborhood pilot shop. The classes above are also described there.

I have inherited a handheld tranceiver from a technology
illiterate roommate, but I don't know what it is or if it is
useful! The only markings on it say:

General Electric
FCC ID AXA9MZTR-121A   MPI SERIES
COMB: P5CRR56BEN

It is clearly a two channel handheld tranceiver, and has
volume and squelch knobs, and a "CG/OFF" switch.

What is it? What is it worth? Can it be modified to run
on Amateur frequencies?

Hi all,

I'm interested in Kenwood's R-5000 receiver and now wonder whether anyone in the net has some experience about it? According to specifications, it seems pretty sensitive on shortwaves but how about mediumwaves? And the audio quality is reportedly better than e.g. in Icom R71. Any comments on its performance?

Please post or drop me e-mail,

Thank you!

Yours,

Jari.

Our club station here at Carnegie-Mellon is finally getting a repeater up and running. (It's been a planned project for several years....) However, it's going to be on 440Mhz, and many of us only have 2-meter rigs. So I was wondering, how difficult would it be to build a (low-power) 440Mhz single-frequency transmitter and receiver. Does anyone out there in net-land have any experience with building such circuits? Or could you point me to the right place to look?

Thanks,
David Apfelbaum, KA2GGL

I have been a ham for 8 months, and have upgraded to advanced class. Would you believe that I've never made a CW QSO? I really would like to get involved in CW, but I feel like a complete ignoramus. I have an ICOM-735 with the built-in keyer. I have these questions:

1) How do I answer a CQ? I hear a guy calling CQ, and I want to answer him, but how? What do I send? Like I say, I'm pretty ignorant.

2) On what frequency do I answer the CQ? If I hear him, do I answer him on that frequency, or do I move the dial until his tone is at the lowest point?

3) Which bands would you recommend for a beginner? Obviously, the novice sections of the bands are good. I like 40 meters, but broadcast stations usually obliterate the band.

Thank you in advance for any help.

Yes indeed. The tapes are under the brand "Gordon West Radio School". You can probably check for ads in ham magazines, or look for it at a ham radio retail store. I love his material too ... much better than the ARRL's stuff. He sells a complete extra class set that I am now studying.

Another place you might check is the US Air Force. The Civil Air Patrol (CAP) receives it's emergency alerts from the Air Force Rescue Coordination

Center (AFRCC) at Scotts AFB. Sorry I don't have any further information.

Hi folks,
Last weekend I got in a bit of ham-radio work while doing my
AFF Stage 3 jump (well, _after_ the chute opened at least),
at the Newcastle Sport Parachute Club, Elderslie NSW.
I've put the question about on voice and packet but had no
definitive answer yet to the following question.
Has this been done before, specifically in Australia? I expect
it's common enough in the U.S., and I've had hints that somebody
did it in Melbourne a few years ago, but I'd like to know for sure.
Any ideas anybody?

Thanks,
Richard.

Many of the repeaters in the Salt Lake City area have super coverage due to good height above average terrain (some in the 5000 to 7000 foot class). When the British THRUST land speed record team was making their attempts in '82 and '83 they were using the SLC repeaters successfully with 1 and 2 watt HTs. Some one else will have to check me on the distances from Dugway and the salt-flats but I think that its over 90 miles. One interesting repeater there is on Antelope Island in the middle of the Great Salt Lake, though not really tall it has an excelent window to the west and south west as well as covering much of the Wasatch front to Orem and the south side of Utah Lake.

The guys in Colorado should back me up on this one; the eastern slope of the Rocky Mtns also affords some fantastic repeater sites which could easily rival or surpass much of the coverage in the rest of the country owing to the uniquly level terrain to the east of Denver.

One suprising repeater is the one on Mt Washington (New Hampshire). Here in Portland, ME we are 90 miles distant and are still well covered by its service, there are places in Portland that are line of sight to Mt Washington. Indeed, the line of sight from Mt Washington extends well out into the ocean, I've seen it from whale watches where the distance was over 120 miles and, no, I didnot have an HT along to try though I am tempted next time.

```

Whoa! Where in Part 97 do you see a distinction drawn between real-time third-party traffic and store-and-forward? That's a distinction drawn by *you* rather than by the FCC. The paragraph addresses the means by which a third party may participate in stating the message. If a message (stated by a third party) comes across the network and is transmitted directly, without human intervention, that third party is stating it without the supervision of a control operator. Of course the control operator can use mechanical aids--I never said he couldn't--but the use of such aids doesn't absolve him of the responsibility to continously monitor and supervise the third party's participation.

The FCC's major concern is not that someone might say a naughty word on the air. They are concerned that unscrupulous people might use amateur frequencies for business or criminal purposes without there being any means of detecting and tracking them. That is the basis of having third-party rules at all, really. When we went down to the FCC a few months ago to brief them on packet developments, most of their questions had to do with how one could detect the presence of illegal traffic and trace it back to its source.

If people decide en masse that "it's better to beg forgiveness than to ask permission," and they start installing Internet<->packet gateways willy nilly, I predict that the eventual result will be a tightening of the rules to prohibit third-party digital connections generally. No one wants that.

[I posted this on 11/16 and 11/26 but it apparantly never get outside Houston. Sorry if you see this twice. --GaryM]

A new launch date has been set for STS-35, Sunday, December 2, 1990 at 0628 UTC. New keplerian elements have been generated and are included below.

The shift timeline for the flight has been changed significantly. A night landing has been approved. This allowed the work shifts to be rescheduled for a 24 hour day instead of the previous 23 hour (approx) day they were using. The 23 hour day was used so that the crew sleep times were shifted away from the deorbit/landing time.

Below are summaries of various bulletins that have appeared about the

STS-35 SAREX flight. I've also included a timeline showing when the Ron (WA4SIR) will be operating SAREX and when the SAREX packet robot will be running.

Mission Audio Rebroadcast

The following stations will rebroadcast the mission audio from the shuttle and ground controllers.

WA3NAN - Goddard Space Flight Center (GSFC), Greenbelt, Maryland.
W5RRR - Johnson Space Center (JSC), Houston, Texas
W6VIO - Jet Propulsion Laboratory (JPL), Pasadena, California.
W6FXN - Los Angeles
K6MF   - San Francisco

Station	VHF	10m	15m	20m	40m	80m
WA3NAN	147.46	28.650	21.395	14.295	7.185	3.860
W5RRR	146.64					
W6VIO	224.04		21.280	14.282	7.165	3.840
W6FXN	145.46					
K6MF	145.58				7.165	3.840

==

W5RRR Special Event Station

W5RRR - Johnson Space Center (JSC) ARC, Houston, TX. Special event station with bulletins, updated element sets, and current flight information will be making contacts and answering questions using SSB on the HF bands. The frequencies are in the chart below. The special event station will start operations on morning of the day after launch (currently 1500 UCT 12/03/90) up thru the landing. W5RRR will also rebroadcast the audio from the contacts between WA4SIR and schools. Three of the 5 bands will be in use at any given time, with band selection determined by propagation.

Station	10m	15m	20m	40m	80m	
W5RRR	28.400	21.350	14.280	7.227	3.850	(+/- QRM)

==

W1AW Voice Bulletins

W1AW will be broadcasting daily bulletins with updated information on SAREX during the flight. Voice bulletins are transmitted daily at 0130 UTC and 0430 UTC on the following frequencies:

Station	10m	15m	20m	40m	80m
W1AW	28.590	21.390	14.290	7.290	3.990

==

AMSAT Net Operations

Information will also be available from the AMSAT net, tune in for bulletins. The net operates every week on:

Sunday	1800-2100 UCT	(international)	14.282 Mhz USB
Tuesday	0130-0300 UCT	(USA)	3.840 Mhz LSB

JSC INFO BBS

The Public Affairs Office at the Johnson Space Center operates a BBS to provide information to the public. Check this board for updates to the keplerian element sets during the flight.

To access the BBS, call +1-713-483-2500 using 1200 baud, 8-N-1, at the ENTER NUMBER: prompt, enter "62511" and you will be connected to the BBS.

NASA JSC's Electronic Space Information BBS is intended to provide 24-hour access to biographies of NASA officials and astronauts, news releases, space flight mission presskits and television schedules, space shuttle systems information, flight manifests and schedules, and other information about the space program.

TNC Settings for SAREX

The packet call sign on board the shuttle is WA4SIR (SSID=0). Your TNC should be in half-duplex mode (FULLDUP OFF) with CD active just like you do for normal VHF packet operations. Your FRACK should be at least 3 seconds. If everybody runs the same DWAIT then everybody will be transmitting at the same time. When uplink QRM is heavy pick a DWAIT that nobody else is using. The FUDtimer on the ROBOT is set for 3 seconds.

[condensed from ANS-230.05/06, originally compiled by W3IWI]

NASA Select Video Broadcast

STS-35/ASTRO-1 Space Shuttle mission television programming will be transmitted daily via the following satellite to accommodate the Alaska and Hawaii audiences:

SPACENET 1
Transponder 17
120 degrees West Long
4040 MHz (Video)
6.8 MHz (Audio)

The continental United States will continue to receive NASA Select television, 24 hours a day throughout the mission, via:

SATCOM F2R (C Band)
Transponder 13
72 degrees West Long
3960 MHz (Video)
6.8 MHZ (Audio)

[condensed from ANS-244.03 by N5QWC]

SAREX Uplink/Downlink Frequencies

Downlink/Uplink Frequencies for Voice QSOs to be used on Upcoming Mission

Get out your HTs and HT programming manuals. You will want to program your 2 meter FM transceivers with the following information.

	Shuttle TX Freq	Shuttle RX Freq	
North/South	145.55 MHz	144.95 MHz	*** Primary ***
American	"	144.91 MHz	
Frequencies	"	144.97 MHz	
Remainder	145.55 MHz	144.95 MHz	*** Primary ***
of the World	"	144.70 MHz	
Frequencies	"	144.75 MHz	
	"	144.80 MHz	
	"	144.85 MHz	

These are the frequencies Ron Parise WA4SIR will use on both voice and packet. Please note that the frequencies Ron will be listening for stations ARE DIFFERENT than the one he will transmit on. This is a very important fact to understand. Ron will transmit to earth (downlink) on a single frequency: 145.55 MHz. He will listen for stations transmitting to him (uplink) on the other frequencies listed. This "split" operation is used quite successfully by DXers when operating in an environment where large pile ups are expected.

The first pair of frequencies (noted as primary) is a standard -600 KHz split used by repeaters. This was done so that communicating with SAREX could be accomplished by Hams using standard FM transceivers. If Ron finds that the receive QRM becomes unmanageable, he may listen on the alternate frequencies listed. In North America, the lower section of the FM repeater bandplan extends as high as 144.90. This is why the uplink frequencies only extend down to 144.91 MHz.

There will be no simplex operation with SAREX on either voice or packet.

Although packeteers are not accustomed to operation with a TX/RX offset, in this case, it is the only way to connect to SAREX. If you transmit on 145.55 MHz the only people who will hear you are those other Hams in your area trying to contact SAREX (You will most likely become an instant celebrity, but not necessarily in the positive sense of the word!).

There should be about 3 KHz of Doppler shift due to the orbital velocity of the Columbia spacecraft. By limiting the deviation of your transmitter to 3 KHz, Ron's receiver should have little trouble capturing your signal.

[This information was extracted from an article written by W3IWI, WA4SIR, and W3XO and published in the March 1990 issue of The AMSAT Journal]

SAREX Packet Operating Hints

HR AMSAT NEWS SERVICE BULLETIN 230.05 FROM AMSAT HQ
HR AMSAT NEWS SERVICE BULLETIN 230.06 FROM AMSAT HQ
SILVER SPRING, MD AUGUST 18, 1990
TO ALL RADIO AMATEURS BT

You learn very quickly when venturing into the world of Packet Radio that unless you use the correct call sign when attempting to connect to another packet station, you won't get too far. Such is the case with the packet operation on SAREX. A number of publications reported earlier this year that the SSID for the SAREX packet ROBOT would be = 1 (ie: WA4SIR-1). Tom Clark, W3IWI, reports that both the HK21 ROBOT TNC and the operational software for the GRID laptop computer have the calls defaulted to WA4SIR (SSID = 0) and that call should be used unless, for some unanticipated reason, the defaults are overridden. Tom continues, the best advice is for you to MONITOR the downlink signals from STS-35 and use whatever call you see on the downlink.

The ROBOT TNC code uses only one SSID at a time.

Because the WA4SIR SAREX ROBOT will be bombarded with signals from tens or hundreds of ground-based users when STS-35 is flying over populated areas, it is not possible for the ROBOT TNC and radio to use normal half-duplex packet procedures -- the CD (carrier detect) signal will simply never drop! The ROBOT will be running in a modified full-duplex mode. When the ROBOT copies a valid packet frame (or when it is time to send a beacon), the data to be sent is put into a buffer and a timer (which is called the FUDtimer) is started. The ROBOT firmware then queues all other outgoing transmissions in the buffer until FUDtimer expires (3 seconds later), and all downlink frames in the queue are sent in one long transmission. You may discover that the response time while running in this mode is sluggish when compared to normal packet operation.

Since the SAREX handheld radio cannot receive when it is transmitting, users should insure that they remain silent and listen when the shuttle is transmitting. In other words, DO NOT RUN FULL DUPLEX ON THE GROUND! Leave your TNC in half-duplex mode (FULLDUP OFF) with CD active just like you do for normal VHF packet operations.

You should be careful with the setting of two of your TNC's timers: DWAIT and FRACK. DWAIT is the time interval after your Carrier Detect light goes out and before your transmitter turns on. You want to make sure your connects requests and ACKs are contained in the 3 second FUDtimer window. If everybody runs the same DWAIT (like the typical 0.1 - 0.5 second values used for terrestrial packet), then everybody will be transmitting at the same time. Part of the key to your success when uplink QRM is heavy is to pick a DWAIT that nobody else is using! (sort of like picking a lottery number!)

FRACK sets the time interval between your transmissions. After you send a frame, your TNC waits for the FRACK time, and then waits for the Carrier Detect signal to drop, then waits DWAIT, and then tries again. You should make sure your FRACK is at least 3 seconds so that you are not transmitting when the ROBOT's FUDtimer decides it is time for it to transmit -- if you are transmitting at the same time, you will miss any packets the shuttle is addressing to you and you won't have a successful QSO.

Note that your DWAIT (how soon do I transmit?) and FRACK (then how long do I wait?) parameters and the need to stop transmitting so you can hear a reply are just like you encounter when working a DXpedition pileup on HF. If the DX station has a pattern of listening for a few seconds (=FUDtimer) before transmitting, you may have better luck being the LAST station they hear, after the din dies down. The differences are that (1) the ROBOT is a computer and is very predictable and (2) the ROBOT can be working several stations at one time.

[ANS thanks W3IWI for compiling the information for this bulletin]

>RE:AMSAT ELEMENT SETS
>
> I have been wondering WHY the good people at AMSAT insists on publishing
>orbital element data in an archaic and expanded format. I have been relaying

The reason is that the AMSAT-format is human-readable. The variety of
different tracking methods & programs being used by amateur radio and other
hobbyists is amazing. Some folks, for example, use hand-held calculators.
Many of these programs cannot handle automated input, hence human-readable
format is most desirable. I'm not trying to justify the use of old software,
just stating the facts.

>I do not understand
>the logic of sending data that takes up twice the space and requires manual
>input to be used.   ^^^^^^^^ ^^^^^^
 ^^^^^
That's not exactly right. Many programs can read the AMSAT-format
automatically. If your software doesn't, then i suggest you obtain
InstantTrack (which i wrote). Available from AMSAT for a small donation.
Nobody should _ever_ be forced to type in long streams of digits. Computers
are supposed to be labor-saving devices!

> It's the same data only in half the space. Is there any one that
>reads this net that knows who to talk to to fix this problem? I see this

Yes. AMSAT has now assigned someone to manage the distribution of orbital
element info. He is: Dick Campbell, N3FKV. He's the official person to
whom you should send your concerns and suggestions re AMSAT's orbital
element distribution.

If I remember rightly the bottom end of the G5RV was designed to come our at about 75 ohms. The original design just connects the bottom end of the OPEN WIRE feeder to the co-ax - no balun.

Louis varney G5RV himself recommends an ATU design with a true balanced output and no balun. He seems to get asked frequently about this and so re-publishes details every now and then. There was a fairly comprehensive article by him on this subject in RADCOM within the past couple of years. These antennas are definately compromise jobs, but do well for what they are. Don't expect low VSWR, if you can use all balanced feed line and balanced ATU. If you get a very bad match at any frequency of importance, you can shift it by changing feeder length.

Quite a number of QRPers use them and with patience and a couple of watts manage to embarrass the kilowatt gang occasionally.

I ran a G5RV for 5 years, used slotted ribbon feeder. Nothing else that would not cause planning trouble would do as well, Im just using a 40M specific antenna at the moment. There is the ARRL wire antenna book and SPRAT often carries wire antenna/ATU info.

Hope this helps   All my own, finest opinions :-)

  From what I understand, RL Drake still services their ham radio
equipment and stocks parts.  They are (presumably) still at their
old address (copied from my C-Line manuals):

     RL Drake Co.
     540 Richard St.

I've had one for a few weeks. I've been playing with it (and translating the
```

manual from Japanish to English so I can figure out how it works) and slowly putting it through its paces. It's an impressive receiver with a lot of flexibility. The controls are fairly intuitive (with glitches here and there).

I upgraded to this from a 2010, and it's attached to an Eavesdropper antenna outside. The differences, as much as I like the Sony, are astounding (which is not a put down of the Sony -- the R5000 costs a LOT more and so it better outperform).

>According to specifications, it
>seems pretty sensitive on shortwaves but how about mediumwaves? And the

It's very good on shortwave. I've done very little DXing on MW so far (no time), but I can, for instance, pull in XTRA (690, Tijunana) some of the time even though KNBR is sitting about 30 miles north blasting out 50K Watts on 680. Between some playing with the filters and some off-band tuning, I can almost make the splatter from the local powerhouse go away. I think once i have a chance to sit down and do some serious MW stuff, it'll perform fine.

Nice toy. Nice performance. I'm impressed.

I am posting this request for a friend, Ray W7QDM:

Does anyone have any QSL route information on the following stations worked during the CQWW CW contest:

J82A
V51Z

Thanks
-Steve

previous replies have only used circular geometry.

the following bit of code compensates for the earth's shape, according to the cited reference.
I whipped this up for the recent 10GHz contest, so it is hardwired for North latitude and West
longitude - apologies to the rest of the world.

paul N1BWT

Strictly speaking, the microprocessor code is permanent in the 751. All that is actually in the battery backed RAM board is data used by that code. The RAM contains the frequencies that define the band edges of the ham bands. It is in BCD form in the lower 256 bytes of the 1KX4 RAM. When the processor determines that the RAM is corrupt it just goes out to lunch to prevent out-of-band transmission.

I think ICOM should have mentioned the RAM feature in the manual (I have an IC-751 and there is no mention at all of the future loss of function.) Another thing that should be in there is instructions on how to remove the RAM board from the radio (without static damage) so that it alone can be shipped to ICOM for re-programming when the battery fails. It seems silly to have to ship the whole radio when it isn't really necessary.

When I first discovered the RAM feature of the ICOM radios I got a schematic of the RAM board from ICOM and figured out how to re-program it myself so that when the battery does go I would be covered. I would consider writing an article for QST with perhaps a schematic for a board that would interface to a PC via RS232 which would allow re-programming any of the RAM boards if there is any interest. Another thing that puzzles me is why someone, ICOM or someone else, hasn't come out with a replacement board with ROM providing the frequency data and RAM for the memories, vfo's etc. It seems like that would be easy and would make everyone happy.

Bruce,

We enjoyed your thread on phased verticals too! Thanks for the followup posting.

Did you consider switching in another phasing loop to turn the beam? You should be able to change the beam direction from end to broadside by a 90 degree phase shift.

Can I operate your station during the ARRL DX CW? <grin>

The KC4SW 52.64 machine, atop Black Mountain (2820' ASL) has coverage
extending from the Santa Cruz mountains to Western Nevada, and about
equal coverage North and West out over the Pacific.

N9EGR in Milwaukee covers most of Northern Illinois, Southern Wisconsin,
and Michigan..

Well a lo tof people there days have multimode rigs for VHF so I would say this is pretty ordinary equipment. Since I am closing in on DXCC on AO-13, I claim it has by FAR the best coverage ;-).

In the northern latitudes we are rapidly approaching 20+ hour days on AO-13 as a matter of course. At my latitude, 10 days out of 18 are 20+ hour days and this will increase. 20 hours of coverage of the globe. We're pretty proud of this. Come join us.

From article <676@kb2ear.UUCP>, by n2aam@kb2ear.UUCP (Dave Marthouse N2AAM):

>
> Is the new software for using the microsats store and forward bbs on line?
>
> If so, can it be gotten via ftp? Any information would be appreciated.
>
> Dave Marthouse
>

Dave:

It is still in pretty rough shape. We are fixing bugs in it as I write this. We finally have it partially working with AEA tnc's. There is some problem with the way hardware handshaking is done in these units or in everybody elses unit. Also, AEA gives a much higher priority to commands than does anyone else. So when the latest version of the bulletin receiver code puts the TNC into kiss mode, since some of them must be followed by restart command, this is generic to the program. Because of AEA's higher priority to commands (user input really), the TNC stops processing the KISS ON command and immediately gives the foreground over to the new incoming command. When it is done receiving it, it sees that it is the second highest priority command (restart) and restarts the tnc without having EVER put the thing into kiss mode. This needs a 1 second delay added to overcome this problem (much less really but Unix time is given inside in 1 second blocks and is transportable across most systems). We are working as fast as volunteers can.

On DOVE:

Please contact G3ZCZ (lives in Md.) at N4QQ. His What's-Up program is the best in the business for decoding satellite telemetry for many birds INCLUDING DOVE. I strongly recommend it over either the one NK6K or I wrote for the Microsats.

NASA also maintains a dialup-bbs with this info. They call it Spacelink. It's geared toward schoolteachers and has a lot of classroom activities and the like, but there are a lot of other neat things to be found. They have some programs for Apple IIs, Macs, and MSdos machines. They also have some GIF files from Voyager and Hubble. The Hubble shot of Saturn is great!

Anyhow the phone number is 205.895.0028. There is a short registration to go thru and you're on. Its a menu driven system, and they have X and Ymodem download.

Have fun!

The classic favorite mode B amplifier is the Mirage/KLM D1010N. It's a linear 10 watt in 100 watt out amp. See the usual ham rags for the best price. Typically around $300.

Why not consider the S-Com 7K instead of the 850? They're becoming the standard here in Colorado.

Yes, 902-928 MHz is a ham band in most of the country as a secondary allocation. However, part 15 low-power devices such as wireless lans, VCR "repeaters", etc. are now allowed. They must not interfere with higher priority users and must accept any interference. (Yeah, right -- try telling that to the business next door when your rig wipes out their wireless lan.)

PETITION (Addendum to Petition for Rulemaking, Docket # ______________)

To: The Honorable Commissioners of the Federal Communications Commission
1919 M Street N.W.
Washington, D.C. 20554

Date: ___________________

WE THE UNDERSIGNED hereby find:

--that during conditions of impaired visibility such as HEAVY FOG or blowing dust, in addition to excessive speed, absence of adequate information about the roadway ahead is a cause of regular, predictable massive vehicle pileups with great injury and loss of life,

--that Citizens Band Radio holds the possibility for reducing that toll by delivering timely information about roadway conditions,

--that lack of information about roadway conditions ahead in general contributes to much congestion, waste of time, excess consumption of fuel, and air pollution which could be avoided if drivers knew to take alternate routes,

--that the existing chaotic, conflicting usage of all CB channels other than Emergency Channel 9 prevents an organized effort to exchange such roadway condition information,

--that Emergency Channel 9 usage is limited to emergency information, excluding information that might prevent such emergencies in the first place,

THEREFORE, we the undersigned hereby support the Petition received September 11, 1990, FCC Docket # _______, petitioning the FCC to designate one of the existing Citizens' Band Radio channels as a "Traffic Advisory" channel with usage limited to warnings, advice, comments, questions, and answers about roadway conditions, and with enforcement provisions similar to those of the Channel 9 Emergency Channel but less restrictive.

```

As promised, I filed my petition with the FCC which they received on September 11 and promptly sent to the Private Radio Bureau where it sits on a stack of 20, first come, first serve. The word from them is that it's a year away from being assigned a docket number. Since we're talking public safety, I am displeased by the delay.

The petition itself is about 3/4 of an inch thick but I will send one to anybody who wants one. Above is a short form of it. There are enough of these out and around in this area for about 8,000 signatures. Most of them are in the hands of various REACT teams. I have a troff version I can send you if you like.

Last week the Manteca City Council unanimously approved a resolution with essentially the same language. I will post or send that also if anyone wishes. I've thrown together a 40" by 60" collage of multi-vehicle fog pileup news photos and news stories for public presentations and, along with several other members of Ripon REACT Team #4777 (which I've joined), I'm taking it to various City Councils and Boards of Supervisors up and down the Central Valley to request similar resolutions. The collage is quite effective. Let me know if you would like to cooperate on making such a presentation in your city and I'll see what I can do.

What I would like to do is keep a steady stream of these petitions flowing into the FCC so that by the time they get to it they will see that it has overwhelming support. If you support this concept, please bury the FCC with signatures.

Thank you.

randall@informix.com (Randall Rhea) writes:
>I have been a ham for 8 months, and have upgraded to advanced class. Would
>you believe that I've never made a CW QSO?

Yes I would! Congratulations by the way, and I hope you enjoy trying CW.

Before answering specific questions, let me refer you to the article in December QST called "Your Novice Accent." It may answer your questions more completely. You'll also learn the most simply by listening.

>1) How do I answer a CQ? I hear a guy calling CQ, and I want to answer him,
>but how? What do I send? Like I say, I'm pretty ignorant.

Say I call CQ like this (typical): CQ CQ CQ DE AA4KB AA4KB AA4KB K

--

You answer like this: AA4KB DE KK6MY KK6MY AR
(The AR is a prosign, sent run together, no space between. didahdidahdit.)

>2) On what frequency do I answer the CQ? If I hear him, do I answer him on
>that frequency, or do I move the dial until his tone is at the lowest point?

You want to answer him on the frequency he's using. That's tricky on a transceiver. His frequency is your dial reading plus (or minus) the audio note you're listening to. The audio note is generated by the difference between his frequency and your BFO.

Most all transceivers provide CW sidetone which is identical to the CW "offset" they use to determine your CW transmitting frequency. So the best way to call him on his frequency is to tune the transceiver so that the note you hear matches the note of your sidetone. (How's your musical pitch memory?)

Some rigs get fancier than that. I'm currently borrowing a Yaesu FT-980. It has a button labeled "CW CAL" which generates a tone equal to the CW sidetone. I can then "zero beat" the incoming signal with the sidetone and know that I'm exactly on his frequency. It also lets me switch between a 500, 600, or 700 Hz offset/sidetone/note.

Be aware that listening to a lower pitch note on CW gives you better discrimination in the event of QRM from nearby stations. It's a real advantage. 500 Hz is a good frequency to listen to.

(The exception to answering on his frequency is working a DX station in a pileup. For that it's best to call up frequency a little bit, and he'll usually listen up frequency a little, so his signal isn't so badly QRM'd by the pileup.)

>3) Which bands would you recommend for a beginner? Obviously, the novice
>sections of the bands are good. I like 40 meters, but broadcast stations
>usually obliterate the band.

40 meters is really an excellent band, day or night. You might like 80 meters as well, if you can put up an antenna for it. Otherwise 15 is great during the daytime. Hard to say. :)

I suggest that you try 40 meters at night anyway, because you can work well between the broadcast stations. Good practice at using your narrow CW filters as well. If you stay up very late, the European broadcast QRM dies down quite a bit, and the band is even nicer. In the wee hours of the morning it's populated with JA's and VK's in the lower 100 kHz.

How to procede with the QSO once you've started ... remember that your first exchange should include the following information in its order of priority: His RST, your QTH, your name. Typically you'll end the text of your transmission like this:

```
                    __                        __
HW? (or SO HW CPY?) AR AA4KB DE KK6MY K  (or KN)
                                                              __
```

Not much need for punctuation ... separate thoughts using the BT prosign.

Say, would you like a sked? I've been working a lot of 40 CW lately, and
love to crank the keyer down and head up to the novice band.

73, Mojo AA4KB

>common in a quick glance through my South Central A/FD.

Just in case anyone really wants to try to DX these things, the compass locators (with the two-character ID) follow a naming pattern that would help you figure out where they are if you have access to a mapping between airport locations and their three-letter identifiers (one such is available by anonymous ftp from uxc.cso.uiuc.edu in pub/nws-city-ids.Z.

LOM's id with the first two letters of the airport identifier that is being served by the marker; LMM's id with the last two. For instance, here in Champaign IL, the airport identifier is CMI, so the LOM id's as "CM". If we had a LMM (we don't), it would id as "MI".

Perhaps the greatest value to hams of such a link as is being discussed would be that hams on a packet network could have access to the vast wealth of information and resources on the internet. I fail to see much value of the average, non-ham, internet user being able to access the packet network's relatively meager resources at this time. Therefore, I would suggest that a solution to this debate would be that initial software on the gateways allow packet network operators (legal by definition:-) access to the internet, however, restrict internet users from accessing the packet network.

I know, I know... (but I want to access my home computer from work:-() well, the gatekeeper could set up passwords, secutity locks, etc. and only allow access to the packet network after verification that the accessee is truely a licensed ham.

(a true programmer will spend days creating software to save 15 minutes once!-)

I dialed into the Kenwood BBS (213) 761-8284 and was quite pleased with the depth of the info on line. Here's a sample:

The following is a copy of the file reflst2.doc which is a list of service bulletins by model number. Each has a file name of sbxxx.doc where xxx is the bulletin number. Use zeros to fill the unused positions - i.e. number 35 would be sb035.doc.

I found that some of the files were missing, but I'm sure that they can be requested.

>ohms (with SWR meter) with the other antenna disconnected (open).

I've often thought about this problem, and I keep running into the same question. How do you guarantee that the phase shifts through both matching networks are identical? As you said, the feed point impedances of the two antennas will probably not be the same, so even if you used a simple L-network for matching, the phase shifts would not be identical. Any significant difference in phase shifts will ruin the pattern of the array.

Where do you get off assuming this sort of nonsense? I am infavor of
such a group, and I LOVE controversy.

>Come on folks, let's not become too stultified. Sure, the code-no code
                        ^^^^^^^^^^
That's why were trying to move the never ending, no new ideas circular
discussions to another group.

>discussion seems unending. So what? I would really prefer to exclude all the
>mentalities that are horrified ("bored") by controversy. Reasoned arguments

Once again, you seem to be a bit confused about motives, and perfectly willing
to make ad-hominem attacks on those who support this idea. If this is your
idea of controversy, bug off.

>are the spice of life. Even the Russians are able to disagree now without
>being sent to Siberia!

Yep - so let's hear some of your reasons, rather than just ad-hominem
flaming, OK?

By the way - next time you see an original thought in the code/no-code
debate, why not let us know? I haven't seen one in a long time.

I have the instructions for the mod to allow out of band transmit for the 32AT, but I wondered if there was anyone here who had done it. I would like to learn of your experience before I go ahead.

(Yes, yes, I know this is all wrong, type-accepted radios, etc., but I want to have a backup to my marine radio in case it goes out just when I need it -- as it did once.)

YES! YES! YES! DO IT! The endless drival in this newsgroup is making it impossible to read. Who cares about nocode, ordering pizza, 8mm camcorders, etc, etc, etc. Maybe this group would have a useable S/N ratio!

Bravo Derek! But why stop with ham.radio-ostrich ;-) how about:

ham.radio-dx
ham.radio-contest <Maybe this one shud be ham.radio.QRM>
ham.radio-code-nocode
ham.radio-antennas
ham.radio-flame
ham.radio-lids
ham.radio-gods.major
ham.radio-gods.minor
...ad nauseam...

See the beauty of this? Then we wouldn't need ham.radio-ostrich ;-)
Come on people, variety is the spice of life as they say, if you don't
like a certain topic theres always the 'n' key, rn macros, kill files
etc. etc. I for one don't believe there is any need to further fragment
this news group. Of course I like hot and spicy Mexican food also and
I realize there are lots of people who don't get much past milk and
cookies :-)

Indeed! You might find that the person with the rough fist is physically
handicapped and might, in reality, be sending with his left foot!
No kidding!

If so, the other party might appreciate the comment on
readibility... especially if you're the first one to try to hang in there
with them. If all others have disappeared, they may be wondering if
hams are friendly.......

Some time ago, someone posted plans for a two-meter co-linear vertical. It was made of pieces of coax soldered up together (short here, don't short there, reverse the shield here, etc). I saved a copy, but seem to have misplaced it. Anyway, now I need a roof-mount antenna. I'm getting started in packet, and I discover that it's done simplex, and the ole 1-watt-to-a-rubber-duckie just won't cut it anymore. So does anybody have that article?

PROPAGATION FORECAST BULLETIN 47 ARLP047
FROM ED TILTON, W1HDQ
SPRING HILL FL NOVEMBER 19, 1990
TO ALL RADIO AMATEURS

THE SOLAR FLUX WAS DOWN TO 140 ON NOVEMBER 2 BUT IT ROSE RAPIDLY, REACHING 215 ONLY FIVE DAYS LATER. IT DROPPED BACK TO 186 BY NOVEMBER 13, BUT RECOVERED QUICKLY AGAIN, RISING TO 223 BY THE 17TH. THIS WAS THE HIGHEST FLUX READING SINCE THE MIDDLE OF OCTOBER.

TWO LARGE SPOT GROUPS THAT CAME INTO THE EAST LIMB OF THE SUN ON THE 14TH SEEMED TO BE THE MAIN SOURCE OF THE RISE. EARLIER GROUPS THAT WERE RESPONSIBLE FOR THE 215 PEAK ON THE 7TH DISAPPEARED AROUND THE WEST LIMB EARLIER IN THE MONTH.

NEITHER OF THE FLUX PEAKS WAS ANYTHING LIKE THE OUTBREAK THAT PRODUCED THE SURPRISE PEAK OF 315 BACK IN AUGUST, BUT THAT CAME AT THE WRONG TIME OF YEAR TO DO MUCH GOOD FOR DXERS.

IF THE REST OF NOVEMBER FOLLOWS RECENT MONTHLY TRENDS, WE CAN EXPECT LOWER FLUX LEVELS THIS WEEK, AND PROBABLY THROUGH THE REST OF THE MONTH. THIS WOULD HAVE LITTLE EFFECT ON THE MAJOR DX BANDS, BUT IT MAY SLOW DOWN DX ACTIVITY ON 50 MHZ, AND POSSIBLY 28 MHZ, ESPECIALLY IN THE LAST DAYS OF THE MONTH.

AMERICAN SUNSPOT NUMBERS FOR NOVEMBER 8 THROUGH 14 WERE 199, 156, 125, 98, 108, 110 AND 115 RESPECTIVELY, WITH A MEAN FIGURE OF 130.1. SOLAR FLUX NUMBERS AS REPORTED BY WWV FOR THE SAME TIME PERIOD WERE 212, 202, 193, 197, 194, 186 AND 201, WITH A MEAN FIGURE OF 198.

On the other hand.....

Many software listings are mighty long. Magazines these days are usually not willing to "waste" their pages on long listings. A good compromise, however, would be for the author or magazine to provide program listings for a nominal cost upon request.

I remember some discussion about recent changes at Heathkit, but not the details. A Brit ham asked me whether they still make amplifier kits (SB-220 e.g.), I told him I thought they didn't but wasn't sure. I guess I can write for their catalog, but if anyone can clarify things meanwhile, please let me know. Even if they do make them I don't think I'd want to pay the shipping charges to the U.K. for one of those things, my arms are already a few inches longer from carrying one around for just a few minutes.

Happy Thanksgiving to all and see you in CQWW this weekend!

About a year ago, while waiting for my novice ticket to arrive in the mail, I built a keyer which is similar to "CMOS Super Keyer II" 11/90 QST. I thought about trying to get an article published, but I felt that the project was probably too expensive "just for a keyer", and doubted that there were many folks out there that had the resources required to customize the firmware.
My keyer is based on the 8031 and an external eprom. This combination has been used in several BYTE projects by Steve Ciarcia, and I found a nice cross assembler on his BBS. In addition to lots of I/O pins on the 8031, there is a built in serial port, which allows me to use my PC's keyboard to send code. I added an nvrom and some extra ram, and an A/D to read a couple of pots for speed control and the like.

If any of you are interested, please drop me a line, and if there is some interest, I will try to find a way to make my stuff available. I'd like to thank Joe, KM4JN, for many good ideas about keyers and Preston Jett for his help with the hardware design.

Bill Welch   AB4YD   uunet!ingr!b11!bill
ps I think the author's of the above mentioned article did a great job, and I wish I had thought of some of the features they did!

I have actually tried this, with varying results:

SRI OM   HAD TROUBLE COPYING NO QRM OR QRN, AND UR SIGS FB, BUT
WHAT DOES CCIIOIICOC MEAN?

If they are trying to send too fast, I may ask them to send slower.

Another one that can drive me up the wall is if I am operating CW mobile, and I hook up with SOMEONEWHORUNSALLTHEWORDSTOGETHER. Very hard to figure out while driving. I just tell them that I copied nothing, and to send a little slower with plenty of time between each word. This problem is especially bad if they can't spell!

This would require a 37.5 ohm quarterwave matching section. 37.5 ohm cable is not off-the-shelf at the local parts house. If instead, you use two 75 ohm matching sections before the combining junction, then two 100 ohm loads in parallel equal 50 ohms. CATV cable is off-the-shelf. Sometimes you need to check your design for what parts are commonly available.

This is my second posting because the one I sent a couple of months ago within Australia was a disaster (nobody responded!) and there might be some reasonable explanations, so either:

a. VK-hams were not interested to answer me
b. there were/are not many VK-hams on the Inet
c. people were lazy to comment believing
   that "someone else" would do so...
d. or I was boring...

Anyway, here it is again.

I have been a ham for 18 years now (I am 31 years old) and back in Yugoslavia I had a call YU6FO (ex YU6ZCW). I am now in Australia with my family and am actively engaged in getting my VK-call soon.

I have taken the trouble of writing this because I feel an urge to learn something about club stations in other countries... Funny, I never asked myself that question when I was in YU because I had a feeling that all the clubs work under similar principles.

The reason: well, to my disappointment I have found out that there are no radio-clubs here in VK4 (I am talking about Brisbane, at least) that have much in common with the organization and activities of the clubs in the area where I used to live - that is YU6 and YU4-land.

As an example I'll take YU6BLM. It was a main radio club in the town called Titograd and was located almost in the very centre (founded back in 1946). The vicinity of a TV station did cause problems a couple of times but we managed to handle them.

Well, the club had several rooms:

- a "social-events" room (general meetings and gatherings)
- a library
- a CW-learning room (with a lot of keyers...)
- a shack (HF, VHF/UHF
- a "spare-parts" room (we called it magazine)

- a do-it-yourself room (with all the tools...)
- a computer room (with C-64 in my time)

We have got a special grant from the Township Committee as an non-profit and educational organization so the rent of these premises was a trifle. Let's say that the renting was almost free!

We found enough retired people who were hams that were more than willing to come every afternoon between 17:00 and 20:00 and open the club for public. They were also taking care of the club's property, etc. Of course, they got paid for this work - it was not much but still it helped them... There were some additional keys of the club which could use just approved persons (those that could be trusted - at least in opinion of the club Secretariat - in fact we never made a mistake and no one complained about this).

We subscribed to several radio-amateur magazines and everybody could come and read them. Also, we managed to complete a pretty good library of electronics and computer books and periodicals.

The money for our activities was coming from several sources:

- Youth organizations
- Educational institutions and organizations
- Industry (Manufacturers,...)
- Township budget

All in all, it was not bad. And we managed to attract a lot of young people. Often it was because they would hear some "dit-dah" noise outside while they were passing-by, and they wanted to check what it was... Or we would give some lectures in schools...

Also, we visited schools (primary and secondary), factories, various organizations, etc. We were organizing joint activities with Scouts Association, Youth Association, Society of blind people, schools, etc.

Usually several times a year we were given some old equipment from the Post, Army, Police, Factories (spare parts were not much of a problem) and that helped us quite a bit.

I can proudly say that probably a couple of hundreds of people learned the basics of Morse code, electronics... in a couple of years time (remember: learning CW takes some six months of work - for an average person that does not want to practice it 20 hours a day).(PLEASE DO NOT COMMENT MUCH ON THE TIME a person needs to learn CW; I learned it in 1972 in ONE DAY and I can cope with speeds of 25-30 groups without problems AND I AM NOT A GENIUS. You know, we all differ!) And I never pushed people into CW - if they wanted to learn I was there to help,

otherwise there were/are so many other interesting activities...
(I personaly dislike contests but I have never laughed at people that think the opposite...)

At the same time, we tried to "spread" our club - actually we realized that in the town with about 100,000 inhabitants one club was not enough. So we began forming other clubs in suburbs and interesting places:

- YU6GBA
- YU6GBB suburb
- YU6GBC
- YU6GBD factory
- YU6GBF
- YU6GAS University of Titograd

In the begining, all these clubs were under supervision of YU6BLM, and later they got their "authonomy" (Hi, what a strong word in the world of ham-radio!).

The equipment in the shack was used only by licenced operators and we never had a problem of a misuse. That way, the hams that could not afford buying their own equipment were still able to practice and work. We even had more equipment than we needed, so it was decided that those hams that could prove having an interest in ham-radio should get some of the equipment and use it at home.

Believe it or not, but back in 1981-1985 (that was a period of blossoming) our clubs were full with members. The parents of children were grateful for the opportunity because they knew where their kids were and what they were doing (please, do not comment on this with jokes...- I have a 3-year old daughter and even NOW am worried what might happen in the future).

Occasionally we would organize some VHF/UHF expeditions and it was wonderful (some of you people might remember those first visits to the rare JB47 locator near the ZA-border...).

All courses and seminars were free. That included the RAEs.
We believed that it would not be fair to children and others if they had to pay for exams... And to be frank, everything costs nowdays so would't it be great to have something FREE.

So, that is about it. I do not want to praise myself and our clubs but would like to know how others deal with this.

Do you have clubs like that? Is it free when you want to take an amateur exam? Do you attract enough youngsters nowdays? What is the main characteristics of the new amateurs (young, male, retired, or...)
(OLDER PEOPLE PLEASE DO NOT FEEL OFFENDED: I have always been looking forward to "recruiting" ANY person in ham-radio, and I stressed the importance of youngsters because the

future belongs to them).

It was not my intention to explain all the details about the activities of radio-clubs (because it would take much more space) - I gave just brief details which might explain some facts.

To all hams that might read this posting I wish good health (before everything!) and enjoy your hobby. That's it: ENJOY IT. And I still like 10m band...

And please comment on this if you have something useful to say, for the benefit of ham-radio (or, at least to satisfy my interest). If you want to make fun or to make others look funny then please mail me direct - without bothering others. Yes, I know it is easy to be smart - and very easy to critisize others!

Dusan (aka Dule), YU6FO/VK4

PS. I talked about the situation in YU6BLM as an example. I do not say we did it the right way (who knows?!) but I really would like to know your way of doing it. And yes, I have no idea what is going on in YU6BLM now...

Jim, unless you can get your program licensed by the FCC as a control operator, it does NOT comply with the rules requiring a control operator to screen traffic before it goes on-air.

>hypercard test me over and over again helped me realize where I needed more
>studying (and helped me with the famous exam nerves syndrome.)

Early in 1990, I set out to complete my New Year's resolution of obtaining my novice and tech license. I went about 2/3 of the way through a class taught by the Stanford amateur radio club, but never took the test. Then a little over a week ago, I found the HyperCard stacks on apple.com (ftp), and decided to go for it once again. I had forgotten almost all of the code I learned at Stanford, but with the Mac "Morse" program, and the HyperCard stacks, I really studied intensely for five days (though my four years studying Electrical Engineering did help too), and last Sunday I took the Novice written test (missed two questions), and the Tech written test (perfect score) and the code test (perfect score). Sure was a hell of a lot easier with the Mac rather than reading the boring books...

>So, Diana, for all of us: Thanks so much!!!

I second that whole-heartedly! One minor thing: The stacks I have don't have any version number (I retrieved them a few weeks ago from apple.com) in them, but they did seem to have some problems occassionally - they would stop in the middle of a test and tell me (on the summary page) that I had missed all of the remaining questions. Strange. Oh well, I passed anyway!

Thanks for the info, It's nice to know that ICOM USA are handling things. The only remaining questions are:

> Is that $25 battery swap conditional upon the rig still functioning, or can they include reprogramming ?
>
> Do ICOM have similar service in other countries ?
>
> Have any other manufacturers used battery maintained firmware?
>
> When rigs are 15 or so years old, how much interest have their manufacturers shown in them ?

I don't have anything at risk myself, but I do seem to be spending an increasing amount of time with other peoples gear laid out on my bench. I just want to be able to avoid such pitfalls as swapping a lithium cell in the safest way (WITH NO EXTERNAL POWER APPLIED) only to discover a catatonic microprocessor.

NB some lithium batteries carry dire warnings of risk of explosion and have maximum permitted reverse currents of 0.05 MICROAMPS. using an external supply carries more risks than just a transient corrupting the data.

```
   Many thanks,   GM4ZNX

Technical Opinion:
I believe Jim transmits from Canada, and thus the FCC has *no* say in the matter. Furthermore, Jim is no doubt aware of the relevant Canadian DOC (Department of Communications) regulations.

Logical Opinion:
But I think you are being a bit picky about the regulations. Being too picky could unduly restrict some pretty major innovations, and I think Jim provides a useful service.

Hello,

Does anyone know of any mods for the TH-25E ??

I am particularly interested in the search feature.....Can I
change it to a search which will hold on the freq. while the
squelch is open..like the scanners...!

This has probably been on the newsgroup before but I would
be grateful for any hints....

I am presently involved in the organization of a Soviet-led
expedition to Bering Island , in the Komandorskij group.
The provisional dates are July22nd - August 18th 1991.

It is possible that there will be one , possibly two, places
unfilled which could be available to ham(s) from the USA.There
are 4 Soviets , 2 Brits (including myself) and 3 Danes, and
3 hams from the USA are required , I believe that all but one or

two of the places for the USA have been filled.

I have more information available for anybody interested , and will be happy to hear from anyone via e-mail.

I can guarantee that it will be a fascinating trip , I was UA0/G0GWA in the Arctic earlier this year and had a great time over there.

73s,

Simon Browne , G0GWA.

Show me where in the regs it says a control operator may not employ mechanical aids to facilitate the screening process by marking for human review all messages containing certain key words and phrases he has selected for use in a grep process.

Let's not try to be more British than the British here. As I said, the FCC expects a good faith effort, but they're not dumb enough to expect 100% accuracy EVEN WITH 100% EYEBALL INSPECTION. No matter how it is done, a tiny percent will slip through when somebody yawns or blinks.

I am not replying to your comment everywhere you posted it. People jump on ME for answering articles in all the newsgroups the originals appeared in. Go figure!

Your description of your old club reminds me a little of the HARC, the Henderson Amateur Radio Club, of my youth. We too had a nice clubhouse on property leased from the city for a dollar a year. We had two state of the art stations setup in rooms at opposite ends of the clubhouse. We had a central meeting room and a kitchen and storage rooms for parts and gear. We had about a hundred active members in a town of 16,000 and sponsored radio clubs in the local schools. We held classes twice a year for new licensees. That's how I got my license, through the school radio club and the HARC classes. We built the first two meter repeater in our area and arranged for a group buy of surplus Motorola 5V tranceivers for our membership. We had great fun sitting around the meeting room trying to modify those beasts to work on two meters. We participated as a club in many contests, especially field day where we made a maximum effort.

I moved away about twenty five years ago and lost touch with the old HARC. Sadly, I met one of the old members last year while visiting the area and found out that the club had fallen apart and had abandoned the clubhouse and the school radio clubs and the licensing classes. They only had about a dozen members left, but they did have one of those talking, singing, dancing, autopatching repeaters on the HARC channel. All of the old partially homebrew radios were gone. And nobody wanted to bother to leave the air-conditioned comfort of their homes to go out in a field with bugs and heat to do field day. They had quit holding meetings and were content to talk to each other via their Japanese made handhelds.

I now live near Atlanta, Georgia and don't know of any clubs like the old HARC. I do know of several clubs like the new HARC. I have no magic wand to bring back the good old days. People seem so busy and wrapped up in their own lives that they don't have time for clubs like the old HARC. It's a great loss to amateur radio.

I'm looking for a schematic for the Hallicrafters S-38 (?) receiver.
I think is a "D" model; it has the two semi-circular dials. If anyone
out there has one, I'd gladly pay copying and postage.

Thanks and 73,
Dube   N5PDK

I dont think that starting any other groups would give any relief at all. Notice how all other ham/shortwave groups only seem to contain multiple postings.

The offending parties are trying to, in their eyes, convert everyone to their views. How can they do this if the unconverted read elsewhere ?

Count on my vote for a .tech group. With the sort of impression that the windbags give, what we enjoy should really bore the pants off them :-) We'd still need kill files to ignore multiple postings.

In response to an article by Bob Hlivak:

Gordon West is a respected individual who happens to make a living preparing people to take amateur radio exams. His course material is available in radio stores (including Radio Shack) and through mail order.

He's done a lot to get more hams into the ranks. I owe my license to his study materials. What he's doing is both legal and ethical. I fail to understand the nature of your outrage.

DIGITAL-TELEMETRY OF "RADIO-M1"

17-Nov-90

by AMSAT-U (RC2CA/UA3CR)
and AMSAT-DL (DG2CV/DB2OS)

Digital telemetry consists of 30 parameters + 2 constants.

To receive the digital telemetry it is necessary to use an FM-receiver, modem, de-scrambler and a personal computer.

Table 1: Digital Telemetry Equations

Line	Parameter	Formula	Unit
1	Transponder #1 HF ouptut pwr	0.2N^2	Watt
2	Transponder #1 PA temperature	0.8*N	deg. C
3	DC/DC converter temperature	0.8*N	deg. C
4	+14 V Regulated	10*N	Volt
5	+24 V Regulated	10*N	Voll
6	+16 V Regulated	10*N	Volt
7	+12 V Regulated	10*N	Volt
8	+9 V Regulated	10*N	Volt

9	+7.5 V Regulated	10*N	Volt
10	+5 V Regulated	10*N	Volt
11	+9 V Regulated (linear)	10*N	Volt
12	+9 V Regulated (digital)	10*N	Volt

>RE:Updated Macintosh Ham Stacks (for HyperCard)
  I was able to get mine via anonymous FTP from apple.com out of their
pub/ham-radio directory. All five stacks are small enough to fit on an
800K floppy when compressed. If any one in the West Texas/New Mexico
area that can't FTP wants a copy, give me a shout.
  I try to keep other PD/Shareware Mac goodies as well.

Bye for now, 73

* SpaceNews 26-Nov-90 *

Bulletin ID: $SPC1126

=========
SpaceNews
=========

MONDAY NOVEMBER 26, 1990

SpaceNews originates at KD2BD in Wall Township, New Jersey, United States. It is published every week and is made available for unlimited distribution.

* RS-14/RUDAK-2 LAUNCH *
========================
AMSAT-DL officials have been informed that the launch of RS-14/RUDAK-2 will occur on or about November 29, 1990, plus or minus one day. Also, it is not expected that the RUDAK-2 transponder will be turned on until three days after launch. Radio amateurs should not expect to hear the CW beacon from RUDAK-2 until December 1, 1990. Efforts are still under way to provide a launch net on 20M starting about an hour before launch. UA3CR requests the help of radio amateurs worldwide to help collect telemetry and send it to him via packet radio to him once the CW beacon is turned on. The CW telemetry beacon can be heard on a downlink frequency of 145.822 or 145.948 MHz SSB.

The CW Morse-Code telemetry frame will consist of the registration call RS14 and 8 four-digit lines in the following format:

```
     RS14  1A 1B 1C 1D
           2A 2B 2C 2D
           3A 3B 3C 3D
           4A 4B 4C 4D
           5A 5B 5C 5D
           6A 6B 6C 6D
           7A 7B 7C 7D
           8A 8B 8C 8D
```

The 1A to 7A lines are analog telemetry data. Line 8A is a calibration engineering parameter.

The first digits from 1A to 8A are system status data. Figure 6 means general operating status and figure 2 means command operating status.

The second digits from 1B to 8B (0 to 7) are line (channel) numbers.

The third and fourth digits from 1C to 8D are analog telemetry values.

RS14 Telemetry Decoding Parameters:

Line #	Parameter	Formula	Unit
0	Transponder power output	0.05N	Watts
1	Transponder PA Temperature	N	Deg. C
2	+24 V Regulated Bus	N	Volts
3	+16 V Regulated Bus	N	Volts
4	+ 9 V Regulated Bus	N	Volts
5	+24 V Regulated Bus	N	Volts
6	Inside Temperature	N	Deg. C
7	Service	N	*

* STS-38 NEWS *

Several independent observers in central Florida and Texas observed Atlantis and the USA 38 spy satellite payload deployment during mission STS-38 last week. Observations seem to indicate that a problem might have occurred with the satellite and it might have been brought back to Earth by the shuttle.

Last night at 0620 UTC (8:20 pm local time) I worked JA1WVK,
a 2 watt station on 20 meter SSB. He was using a TH7DX tribander,
but I was still surprised at his signal strength, about S-2. On
my end I'm using just a G5RV dipole (3/2 wave) at 100 feet, and 100 watts.
I also tried reducing power, and he could hear me at the 1 watt level.

Naturally, after 5 minutes or so at QRP some LID came up practically
on top of us so I had to increase power again... we tried 15 meters but
no contact was made.

For the curious, Yoshi's rig was a Mizuho MX14S monoband transceiver.
He had a similar monobander for 15 meters.

The moral of the story is: Even on DX alley of 20 meters you can run
low power. It sure does help to have a good antenna! Of course,
if we had been on 10 meters, the QSO would have been a lot longer.

Jim has transmitted from Toledo, Ohio, for almost 40 years, but that's beside the point. The FCC regulations specify certain prohibited types of communications. They don't say diddly about HOW the control operator goes about achieving compliance. For all the FCC cares, the control operator could hire that band of monkeys who could write the complete works of William Sheakespeare of you give them enough time.

I was under the impression that anyone entering a service academy was intelligent enough to realize that (a) he was entering into a contract voluntarily and (b) that he had read and understood it before signing.

My mistake.

You know, I get a little griped by the intellectuals who look down their noses at soldiers, policemen, etc., as somehow inferior and/or deranged UNTIL "the gook" or "the perp" gets into their personal space and THEN they scream "What took you so long to get here?"

Such is life.

OK, but what do you do about the tuned circuits? Wouldn't you also have to retune the driver and finals?

To: info-hams@ucsd.edu

I was talking to John Moore NJ7E today, and he asked me how the callsign project was going. I told him, and he panicked. (Well,almost) So, he suggested that I remind everyone that the callsign project is currently underway (I await the data from the NTIS which I ordered a month ago)!

Get those cards and tapes in the mail, please! :-)

(Why did he near-panic? Because I told him it looked like the money I had planned to spend on a dual-bander for the car would go instead to pay for the FCC database... oops! :-(

Subject: Club stations...
To: info-hams@ucsd.edu

This is my second posting because the one I sent a couple of months ago within Australia was a disaster (nobody responded!) and there might be some reasonable explanations, so either:

a. VK-hams were not interested to answer me
b. there were/are not many VK-hams on the Inet
c. people were lazy to comment believing
   that "someone else" would do so...
d. or I was boring...

Anyway, here it is again.

I have been a ham for 18 years now (I am 31 years old) and back in Yugoslavia I had a call YU6FO (ex YU6ZCW). I am now in Australia with my family and am actively engaged in getting my VK-call soon.

I have taken the trouble of writing this because I feel an urge to learn something about club stations in other countries... Funny, I never asked myself that question when I was in YU because I had a feeling that all the clubs work under similar principles.

The reason: well, to my disappointment I have found out that there are no radio-clubs here in VK4 (I am talking about Brisbane, at least) that have much in common with the organization and activities of the clubs in the area where I used to live - that is YU6 and YU4-land.

As an example I'll take YU6BLM. It was a main radio club in the town called Titograd and was located almost in the very centre (founded back in 1946). The vicinity of a TV station did cause problems a couple of times but we managed to handle them.

Well, the club had several rooms:

- a "social-events" room (general meetings and gatherings)
- a library
- a CW-learning room (with a lot of keyers...)
- a shack (HF, VHF/UHF
- a "spare-parts" room (we called it magazine)
- a do-it-yourself room (with all the tools...)
- a computer room (with C-64 in my time)

We have got a special grant from the Township Committee as an non-profit and educational organization so the rent of these premises was a trifle. Let's say that the renting was almost free!

We found enough retired people who were hams that were more than willing to come every afternoon between 17:00 and 20:00 and open the club for public. They were also taking care of the club's property, etc. Of course, they got paid for this work - it was not much but still it helped them... There were some additional keys of the club which could use just approved persons (those that could be trusted - at least in opinion of the club Secretariat - in fact we never made a mistake and no one complained about this).

We subscribed to several radio-amateur magazines and everybody could come and read them. Also, we managed to complete a pretty good library of electronics and computer books and periodicals.

The money for our activities was coming from several sources:

- Youth organizations
- Educational institutions and organizations
- Industry (Manufacturers,...)
- Township budget

All in all, it was not bad. And we managed to attract a lot of young people. Often it was because they would hear some "dit-dah" noise outside while they were passing-by, and they wanted to check what it was... Or we would give some lectures in schools...

Also, we visited schools (primary and secondary), factories, various organizations, etc. We were organizing joint activities with Scouts Association, Youth Association, Society of blind people, schools, etc.

Usually several times a year we were given some old equipment from the Post, Army, Police, Factories (spare parts were not much of a problem) and that helped us quite a bit.

I can proudly say that probably a couple of hundreds of people learned the basics of Morse code, electronics... in a couple of years time (remember: learning CW takes some six months of work - for an average person that does not want to practice it 20 hours a day).(PLEASE DO NOT COMMENT MUCH ON THE TIME a person needs to learn CW; I learned it in 1972 in ONE DAY and I can cope with speeds of 25-30 groups without problems AND I AM NOT A GENIUS. You know, we all differ!) And I never pushed people into CW - if they wanted to learn I was there to help, otherwise there were/are so many other interesting activities... (I personaly dislike contests but I have never laughed at people that think the opposite...)

At the same time, we tried to "spread" our club - actually we realized that in the town with about 100,000 inhabitants one club was not enough. So we began forming other clubs in suburbs and interesting places:

- YU6GBA
- YU6GBB suburb
- YU6GBC
- YU6GBD factory
- YU6GBF
- YU6GAS University of Titograd

In the begining, all these clubs were under supervision of YU6BLM, and later they got their "authonomy" (Hi, what a strong word in the world of ham-radio!).

The equipment in the shack was used only by licenced operators and we never had a problem of a misuse. That way, the hams that could not afford buying their own equipment were still able to practice and work. We even had more equipment than we needed, so it was decided that those hams that could prove having an interest in ham-radio should get some of the equipment and use it at home.

Believe it or not, but back in 1981-1985 (that was a period of blossoming) our clubs were full with members. The parents of children were grateful for the opportunity because they knew where their kids were and what they were doing (please, do not comment on this with jokes...- I have a 3-year old daughter and even NOW am worried what might happen in the future).

Occasionally we would organize some VHF/UHF expeditions and it was wonderful (some of you people might remember those first visits to the rare JB47 locator near the ZA-border...).

All courses and seminars were free. That included the RAEs. We believed that it would not be fair to children and others if they had to pay for exams... And to be frank, everything costs nowdays so would't it be great to have something FREE.

So, that is about it. I do not want to praise myself and our clubs but would like to know how others deal with this.

Do you have clubs like that? Is it free when you want to take an amateur exam? Do you attract enough youngsters nowdays? What is the main characteristics of the new amateurs (young, male, retired, or...)
(OLDER PEOPLE PLEASE DO NOT FEEL OFFENDED: I have always been looking forward to "recruiting" ANY person in ham-radio, and I stressed the importance of youngsters because the future belongs to them).

It was not my intention to explain all the details about the activities of radio-clubs (because it would take much more space) - I gave just brief details which might explain some facts.

To all hams that might read this posting I wish good health (before everything!) and enjoy your hobby. That's it: ENJOY IT. And I still like 10m band...

And please comment on this if you have something useful to say, for the benefit of ham-radio (or, at least to satisfy my interest). If you want to make fun or to make others look funny then please mail me direct - without bothering others. Yes, I know it is easy to be smart - and very easy to critisize others!

On the other hand.....

Many software listings are mighty long. Magazines these days are usually not willing to "waste" their pages on long listings. A good compromise, however, would be for the author or magazine to provide program listings for a nominal cost upon request.

Subject: Glen Hauser to move to WWCR! (Listening Tip)
To: info-hams@ucsd.edu

Popular Monitoring Times Columnist and host of WORLD OF RADIO, Glen Hauser will be heard on WWCR, The powerhouse international broadcaster, beginning Sunday 25 November 1990. His broadcasts will then be aired regularly thereafter. Convieniently scheduled for 8:30pm Eastern Standard Time (0130UTC while the USA is on Standard Time), and blasted out with a few MILLION watts of ERP on 7520 KHZ, Glen will be heard for the first time reliably in Europe.

You might be aware that Glen's WORLD OF RADIO has aired for many years over WRNO, the one time powerhouse gone flea power. With the WRNO signal now more of a JOKE than a broadcast service, Hauser has made the right move.

Interestingly, the program will air RIGHT BEFORE the four hour weekly broadcasts of RADIO NEW YORK INTERNATIONAL, making sunday a true night for good listening for the shortwave buff.

If you are a regular listener of Hauser's program, you are no doubt aware that it is a mixture of Good DX and station news, tips, tidbits, and a smattering of left wing political commentary. Hauser is an athiest, and in the past has featured "TIPS FOR RATIONAL LIVING" as part of his program. This feature ridicules religious practice, and promotes humanism. I will be very interested to see if Hauser continues this feature now that his program will be heard over WWCR, which is a Christian Station.

Most of the programs aired during the week on WWCR are a mix of Religious programs, most of them in the old time religion vein during the day. In the evening, the station switches to talk shows from the SUN RADIO NETWORK, with Chuck Harder (Consumer help and weird science) and Tom Valentine (Right Wing Politics and WEIRDER science).

Last week Harder talked about the N-MACHINE, which is a device that is supposed to produce more electric power than it takes in, making it in effect a perpetual motion machine. Valentine, not to be outdone, had on a man who claims that his invention has lowered SMOG in Los Angeles, through manipulation of the "ether". The anti-smog machine has no moving parts, but relies on its geometric shape to dispell the noxious fumes. He wants the Los Angeles City Government to pay him a million dollars a month to continue his services. He cites the figures that prove his device works, and even uses newspaper headlines about lower smog levels. Since Los Angeles is ignoring him, he is packing up his technology and going to Japan with it. He says "Just you watch. NEXT YEAR the smog levels will increase". Of course if they do, he will have all the impirical evidence he needs. And if they don't... Well we won't hear from HIM any more.

In any case, HAUSER has also ridiculed these programs, and encouraged people who have any scientific knowledge to call and try and debunk these guys. When someone DOES call though, Valentine refuses to let them speak if they disagree, or he chides them. After being so critical of the station and its programming, Hauser now finds himself on the same station.

It is probably NO ACCIDENT though that WORLD OF RADIO will be airing immediately before RNI's weekly shows.

=====

RNI and its rotating schedule

=====

7520 KHZ 0200 - 0600 Z Via WWCR Sunday (USA) Monday (UTC)

Radio NewYork International, meanwhile has settled down to a very regular schedule. Unfortunately, the best program host (Johnny Lightning) is heard only once a week. My own personal LEAST-favorite (Pirate Joe) is heard twice a month (or more depending on the month) Now if you are a lefty liberal 1960's anti war-save the wales-peacenick who gets into those old vietnam era protest songs and mindset, YOUR mileage might vary. I prefer irreverance and biting satire, ala Johnny Lightning to the predictable Pirate Joe. Other shows include "A different kind of oldies show" which is not all that different a kind of oldies show, really... AND the Steele Ship (host Randi Steele), who is in a similar mold to pirate joe, but not quite as bad. So far, the WORST RNI program was Pirate Joe broadcasting a distorted recording of the ANTI WAR rally which took place in NYC in protest of the Desert Shield Situation. Joe must be in his glory with another war to protest. EVERYONE I know who listens to RNI flipped the station off after the program got interminable. I bet even the most loyal RNI listeners just could not take this program. HOW ABOUT IT, ANYONE ELSE LISTEN THAT NIGHT?

That's all of my time.

Thank you for Yours.

Help!

I would like to obtain the ground station software for the new pac-sats. Would anyone consider mailing me a copy on disk...(360k,1.2meg or 1.44meg)?

I have a compuserve account that I have not used in over 3.5 years....frankly I forgot all the local acess numbers and how to use the networks to get into it. (I DO remember my account and password!)

I really do not want to call the Dallas DRIG BBS....I have only have access to 300 baud during daytime rates!

Thanks for your help in advance......

From: pilchuck!ssc!tad@uunet.uu.net (Tad Cook)
Subject: ICOM Batteries (memory)
To: info-hams@ucsd.edu

There have been several postings on here lately about the battery in some ICOM HF radios that holds memory. Some folks fear that the battery will wear out in a few years, and they sill be stuck with a microprocessor controlled radio with no "brains."

I talked to Bill Everett of ICOM today. He said that the batteries in ICOM radios (I'm NOT talking about the battery that POWERS your HT!) have a predicted life of over 15 years. If you want to replace yours before it runs out, and are afraid of losing memory, float a power supply across the battery that is set at about the same voltage as the battery. Then remove the battery, and replace it. Keeping voltage on it will keep the memory alive.

If you want ICOM to do it, you can send in your radio, and for $25 they will replace the battery. This includes parts and labor.

If you want to contact Bill Everett at ICOM, his email address is
76702.753@compuserve.com

He has some trouble replying to internet mail though. Listing a couple of variations of domain addresses could help if you want a reply.

Piffle! A good EDMEESE type program should catch 99.9% of the possible improper
messages. As long as we make a good faith effort to comply, the FCC won't
nitpick if an occasional clinker slips through.

Me, too, but what good is it if everyone does multiple posts? With RARE
exceptions the only time I post an article in two or more newsgroups is in
reply to someone else who did (and I'm therefore uncertain which one he's
actually reading). But some people do it habitually. That would tend to defeat
the purpose.

When we say rec.ham-radio.legal, are we including tower cases, etc., or only

FCC regulatory matters? If the latter, then rec.ham-radio.fcc might be more
descriptive.

Subject: Callsign project
To: info-hams@ucsd.edu

I was talking to John Moore NJ7E today, and he asked me how the callsign project was going. I told him, and he panicked. (Well,almost) So, he suggested that I remind everyone that the callsign project is currently underway (I await the data from the NTIS which I ordered a month ago)!

Get those cards and tapes in the mail, please! :-)

(Why did he near-panic? Because I told him it looked like the money I had planned to spend on a dual-bander for the car would go instead to pay for the FCC database... oops! :-(

Subject: Club stations...
To: info-hams@ucsd.edu

This is my second posting because the one I sent a couple of months ago within Australia was a disaster (nobody responded!) and there might be some reasonable explanations, so either:

a. VK-hams were not interested to answer me

 b. there were/are not many VK-hams on the Inet
 c. people were lazy to comment believing
    that "someone else" would do so...
 d. or I was boring...

Anyway, here it is again.

I have been a ham for 18 years now (I am 31 years old) and back in Yugoslavia I had a call YU6FO (ex YU6ZCW). I am now in Australia with my family and am actively engaged in getting my VK-call soon.

I have taken the trouble of writing this because I feel an urge to learn something about club stations in other countries... Funny, I never asked myself that question when I was in YU because I had a feeling that all the clubs work under similar principles.

The reason: well, to my disappointment I have found out that there are no radio-clubs here in VK4 (I am talking about Brisbane, at least) that have much in common with the organization and activities of the clubs in the area where I used to live - that is YU6 and YU4-land.

As an example I'll take YU6BLM. It was a main radio club in the town called Titograd and was located almost in the very centre (founded back in 1946). The vicinity of a TV station did cause problems a couple of times but we managed to handle them.

Well, the club had several rooms:

- a "social-events" room (general meetings and gatherings)
- a library
- a CW-learning room (with a lot of keyers...)
- a shack (HF, VHF/UHF
- a "spare-parts" room (we called it magazine)
- a do-it-yourself room (with all the tools...)
- a computer room (with C-64 in my time)

We have got a special grant from the Township Committee as an non-profit and educational organization so the rent of these premises was a trifle. Let's say that the renting was almost free!

We found enough retired people who were hams that were more than willing to come every afternoon between 17:00 and 20:00 and open the club for public. They were also taking care of the club's property, etc. Of course, they got paid for this work - it was not much but still it helped them... There were some additional keys of the club which could use just approved persons (those that could be trusted - at least in opinion of the club Secretariat - in fact we never made a mistake and no one complained about this).

We subscribed to several radio-amateur magazines and everybody could come and read them. Also, we managed to complete a pretty good library of electronics and computer books and periodicals.

The money for our activities was coming from several sources:

- Youth organizations
- Educational institutions and organizations
- Industry (Manufacturers,...)
- Township budget

All in all, it was not bad. And we managed to attract a lot of young people. Often it was because they would hear some "dit-dah" noise outside while they were passing-by, and they wanted to check what it was... Or we would give some lectures in schools...

Also, we visited schools (primary and secondary), factories, various organizations, etc. We were organizing joint activities with Scouts Association, Youth Association, Society of blind people, schools, etc.

Usually several times a year we were given some old equipment from the Post, Army, Police, Factories (spare parts were not much of a problem) and that helped us quite a bit.

I can proudly say that probably a couple of hundreds of people learned the basics of Morse code, electronics... in a couple of years time (remember: learning CW takes some six months of work - for an average person that does not want to practice it 20 hours a day).(PLEASE DO NOT COMMENT MUCH ON THE TIME a person needs to learn CW; I learned it in 1972 in ONE DAY and I can cope with speeds of 25-30 groups without problems AND I AM NOT A GENIUS. You know, we all differ!) And I never pushed people into CW - if they wanted to learn I was there to help, otherwise there were/are so many other interesting activities... (I personaly dislike contests but I have never laughed at people that think the opposite...)

At the same time, we tried to "spread" our club - actually we realized that in the town with about 100,000 inhabitants one club was not enough. So we began forming other clubs in suburbs and interesting places:

- YU6GBA
- YU6GBB suburb
- YU6GBC
- YU6GBD factory
- YU6GBF
- YU6GAS University of Titograd

In the begining, all these clubs were under supervision of YU6BLM, and later they got their "authonomy" (Hi, what a strong word in the world of ham-radio!).

The equipment in the shack was used only by licenced operators and we never had a problem of a misuse. That way, the hams that could not afford buying their own equipment were still able to practice and work. We even had more equipment than we needed, so it was decided that those hams that could prove having an interest in ham-radio should get some of the equipment and use it at home.

Believe it or not, but back in 1981-1985 (that was a period of blossoming) our clubs were full with members. The parents of children were grateful for the opportunity because they knew where their kids were and what they were doing (please, do not comment on this with jokes...- I have a 3-year old daughter and even NOW am worried what might happen in the future).

Occasionally we would organize some VHF/UHF expeditions and it was wonderful (some of you people might remember those first visits to the rare JB47 locator near the ZA-border...).

All courses and seminars were free. That included the RAEs. We believed that it would not be fair to children and others if they had to pay for exams... And to be frank, everything costs nowdays so would't it be great to have something FREE.

So, that is about it. I do not want to praise myself and our clubs but would like to know how others deal with this.

Do you have clubs like that? Is it free when you want to take an amateur exam? Do you attract enough youngsters nowdays? What is the main characteristics of the new amateurs (young, male, retired, or...)
(OLDER PEOPLE PLEASE DO NOT FEEL OFFENDED: I have always been looking forward to "recruiting" ANY person in ham-radio, and I stressed the importance of youngsters because the future belongs to them).

It was not my intention to explain all the details about the activities of radio-clubs (because it would take much more space) - I gave just brief details which might explain some facts.

To all hams that might read this posting I wish good health (before everything!) and enjoy your hobby. That's it: ENJOY IT. And I still like 10m band...

And please comment on this if you have something useful to say, for the benefit of ham-radio (or, at least to satisfy my interest). If you want to make fun or to make others look funny then please mail me direct - without bothering others. Yes, I know it is easy to be smart - and very easy to critisize others!

On the other hand.....

Many software listings are mighty long. Magazines these days are usually not willing to "waste" their pages on long listings. A good compromise, however, would be for the author or magazine to provide program listings for a nominal cost upon request.

Subject: Glen Hauser to move to WWCR! (Listening Tip)
To: info-hams@ucsd.edu

Popular Monitoring Times Columnist and host of WORLD OF RADIO, Glen Hauser will be heard on WWCR, The powerhouse international broadcaster, beginning Sunday 25 November 1990. His broadcasts will then be aired regularly thereafter. Convieniently scheduled for 8:30pm Eastern Standard Time (0130UTC while the USA is on Standard Time), and blasted out with a few MILLION watts of ERP on 7520 KHZ, Glen will be heard for the first time reliably in Europe.

You might be aware that Glen's WORLD OF RADIO has aired for many years over WRNO, the one time powerhouse gone flea power. With the WRNO signal now more of a JOKE than a broadcast service, Hauser has made the right move.

Interestingly, the program will air RIGHT BEFORE the four hour weekly broadcasts of RADIO NEW YORK INTERNATIONAL, making sunday a true night for good listening for the shortwave buff.

If you are a regular listener of Hauser's program, you are no doubt aware that it is a mixture of Good DX and station news, tips, tidbits, and a smattering of left wing political commentary. Hauser is an athiest, and in the past has featured "TIPS FOR RATIONAL LIVING" as part of his program. This feature ridicules religious practice, and promotes humanism. I will be very interested to see if Hauser continues this feature now that his program will be heard over WWCR, which is a Christian Station.

Most of the programs aired during the week on WWCR are a mix of Religious programs, most of them in the old time religion vein during the day. In the evening, the station switches to talk shows from the SUN RADIO NETWORK, with Chuck Harder (Consumer help and weird science) and Tom Valentine (Right Wing Politics and WEIRDER science).

Last week Harder talked about the N-MACHINE, which is a device that is supposed to produce more electric power than it takes in, making it in effect a perpetual motion machine. Valentine, not to be outdone, had on a man who claims that his invention has lowered SMOG in Los Angeles, through manipulation of the "ether". The anti-smog machine has no moving parts, but relies on its geometric shape to dispell the noxious fumes. He wants the Los Angeles City Government to pay him a million dollars a month to continue his services. He cites the figures that prove his device works, and even uses newspaper headlines about lower smog levels. Since Los Angeles is ignoring him, he is packing up his technology and going to Japan with it. He says "Just you watch. NEXT YEAR the smog levels will increase". Of course if they do, he will have all the impirical evidence he needs. And if they don't... Well we won't hear from HIM any more.

In any case, HAUSER has also ridiculed these programs, and encouraged people who have any scientific knowledge to call and try and debunk these guys. When someone DOES call though, Valentine refuses to let them speak if they disagree, or he chides them. After being so critical of the station and its programming, Hauser now finds himself on the same station.

It is probably NO ACCIDENT though that WORLD OF RADIO will be airing immediately before RNI's weekly shows.

=====

RNI and its rotating schedule

=====

7520 KHZ 0200 - 0600 Z Via WWCR Sunday (USA) Monday (UTC)

Radio NewYork International, meanwhile has settled down to a very regular schedule. Unfortunately, the best program host (Johnny

Lightning) is heard only once a week. My own personal LEAST-favorite (Pirate Joe) is heard twice a month (or more depending on the month) Now if you are a lefty liberal 1960's anti war-save the wales-peacenick who gets into those old vietnam era protest songs and mindset, YOUR mileage might vary. I prefer irreverance and biting satire, ala Johnny Lightning to the predictable Pirate Joe. Other shows include "A different kind of oldies show" which is not all that different a kind of oldies show, really... AND the Steele Ship (host Randi Steele), who is in a similar mold to pirate joe, but not quite as bad. So far, the WORST RNI program was Pirate Joe broadcasting a distorted recording of the ANTI WAR rally which took place in NYC in protest of the Desert Shield Situation. Joe must be in his glory with another war to protest. EVERYONE I know who listens to RNI flipped the station off after the program got interminable. I bet even the most loyal RNI listeners just could not take this program. HOW ABOUT IT, ANYONE ELSE LISTEN THAT NIGHT?

That's all of my time.

Thank you for Yours.

Help!

I would like to obtain the ground station software for the new pac-sats. Would anyone consider mailing me a copy on disk...(360k,1.2meg or 1.44meg)?

I have a compuserve account that I have not used in over 3.5 years....frankly I forgot all the local acess numbers and how to use the networks to get into it. (I DO remember my account and password!)

I really do not want to call the Dallas DRIG BBS....I have only have access to

300 baud during daytime rates!

Thanks for your help in advance......

Subject: ICOM Batteries (memory)
To: info-hams@ucsd.edu

There have been several postings on here lately about the battery in some ICOM HF radios that holds memory. Some folks fear that the battery will wear out in a few years, and they sill be stuck with a microprocessor controlled radio with no "brains."

I talked to Bill Everett of ICOM today. He said that the batteries in ICOM radios (I'm NOT talking about the battery that POWERS your HT!) have a predicted life of over 15 years. If you want to replace yours before it runs out, and are afraid of losing memory, float a power supply across the battery that is set at about the same voltage as the battery. Then remove the battery, and replace it. Keeping voltage on it will keep the memory alive.

If you want ICOM to do it, you can send in your radio, and for $25 they will replace the battery. This includes parts and labor.

If you want to contact Bill Everett at ICOM, his email address is
76702.753@compuserve.com

He has some trouble replying to internet mail though. Listing a couple of variations of domain addresses could help if you want a reply.

Piffle! A good EDMEESE type program should catch 99.9% of the possible improper messages. As long as we make a good faith effort to comply, the FCC won't nitpick if an occasional clinker slips through.

Me, too, but what good is it if everyone does multiple posts? With RARE exceptions the only time I post an article in two or more newsgroups is in reply to someone else who did (and I'm therefore uncertain which one he's actually reading). But some people do it habitually. That would tend to defeat the purpose.

When we say rec.ham-radio.legal, are we including tower cases, etc., or only FCC regulatory matters? If the latter, then rec.ham-radio.fcc might be more descriptive.

Does humour imitate life?

Because of all the "It's illegal" carping of the narrow minded I and others have suggested that we create wrecked.ham-radio.lawyer etc. This has been a quiet giggle for the past year or so. In fact, just for giggles I have even created a newsgroup in my active file called rec.ham-radio.lawyer.

It is interesting to note that the dull dreary goody-goody attitude of the narrow minded has lead to the suggestion that they get their own forum. But at least this will give them an opportunity to drone on endlessly about matters legal and bureaucratic.

Of all the postings I have made here over the past 18 months, the one that got the most response was a scenario I fabricated to excite the armchair lawyers. I invented a scenario where I was on an auto-patch and someone put me on hold. While on hold, a song and two ads were played over the repeater. The response to this posting went on for weeks. If I ask anything slightly technical, it is usually ignored.

Maybe we should just call this group:
rec.ham-radio.humourless-bureaucrat

Why feed these people? Why don't we ignore them? Let's treat them with the contempt which they deserve. Giving them a news group will not stop them posting to rec.ham-radio saying: "Nja-nja, you can't do that. I'm going to tell the FCC about you."

Some of my most instructive hamming was illegal. Yes, I will even admit to running illegal phone patches on 2M and 23 cM between Sweden and Denmark. So I suppose I am now an international felon. I have even worked Germany, Holland, Belgium, Denmark and England from a commercial aircraft using a 2M walkie-talkie. So want to know if you can do this from a plane? Sure you can. Did it crash? Obviously not. Did I have the captains permission? Well on some these jaunts the captain (an SM) and I took turns working the rig. But 1,125 posters here will tell you that the plane will crash and you will go to hell after you have been to prison.

We now return you to the "You can't do that" postings that clutter this forum.

P.S. Loved the posting about not being allowed to use radios on Amtrak. Very funny.

You have a serious impedance mismatch in the system and are attempting to
compensate for it by introducing reactance by detuning the antennas. This
is the wrong approach. You need to use a section of 75 ohm line a quarter
wavelength long from each antenna to the combined feedpoint. The 75 ohm
quarter wave transmission line transformers will change the 50 ohm base
impedance of each antenna to 100 ohms. Summing the two 100 ohm feedlines
in parallel will result in a feedpoint impedance of 50 ohms. The quarter
wave phasing difference you need for a directional pattern can be obtained
by adding a quarter wave section of 50 ohm line between the end of one
of the 75 ohm transformers and one of the antennas. Tune each antenna
individually for a good 50 ohm match at resonance. There will be some
near field interaction when both antennas are driven. Do not readjust the
the resonant frequency of the antennas. Instead, readjust the base matching
networks to regain a 50 ohm match at each antenna base. Alternately you
can insert RF ammeters in the base of each tower and adjust your matching
networks for equal currents. This is a simplified view of the way we
do it in the broadcast biz.

Subject: rn KILL files
To: info-hams@ucsd.edu

Other rn users may find the following macro useful as an alternative to keeping a global kill file around. The macro causes all unread postings with the same author as the one currently displayed to be marked as read. This gem has been kicking around for awhile and was posted (somewhere, sometime) by dave@Galaxia.Newport.RI.US (David H. Brierley). I've bound it to the ^x (control x) key sequence since rot13 files are a rarity in the groups I read, but you can make the obvious change to bind it to another key. Using it in conjunction with the 'k' command to mark all unread postings with the same *subject line* as the one currently being displayed goes a long way towards preserving my sanity. Just place the following line in a file called .rnmac in your home directory (or add the line if you already have a .rnmac file).

```
^x %(%m=[ap]?/%t/h\:j^J:t)
```

When you encounter this first posting by a known drivel monger, just type ^x. Since the worst offenders usually make *lots* of postings, you often get to watch a long series of 'article nnnnn junked' messages scroll by. Its actually kind of satisying ;-)

Right. Guys in Chicago in the Good Old Days would kill to get Gould to slip
their ham callsigns into the Dick Tracy comic strip, which he did regularly.

PROPAGATION FORECAST BULLETIN 47 ARLP047
FROM ED TILTON, W1HDQ
SPRING HILL FL NOVEMBER 19, 1990
TO ALL RADIO AMATEURS

THE SOLAR FLUX WAS DOWN TO 140 ON NOVEMBER 2 BUT IT ROSE RAPIDLY, REACHING 215 ONLY FIVE DAYS LATER. IT DROPPED BACK TO 186 BY NOVEMBER 13, BUT RECOVERED QUICKLY AGAIN, RISING TO 223 BY THE 17TH. THIS WAS THE HIGHEST FLUX READING SINCE THE MIDDLE OF OCTOBER.

TWO LARGE SPOT GROUPS THAT CAME INTO THE EAST LIMB OF THE SUN ON THE 14TH SEEMED TO BE THE MAIN SOURCE OF THE RISE. EARLIER GROUPS THAT WERE RESPONSIBLE FOR THE 215 PEAK ON THE 7TH DISAPPEARED AROUND THE WEST LIMB EARLIER IN THE MONTH.

NEITHER OF THE FLUX PEAKS WAS ANYTHING LIKE THE OUTBREAK THAT PRODUCED THE SURPRISE PEAK OF 315 BACK IN AUGUST, BUT THAT CAME AT THE WRONG TIME OF YEAR TO DO MUCH GOOD FOR DXERS.

IF THE REST OF NOVEMBER FOLLOWS RECENT MONTHLY TRENDS, WE CAN EXPECT LOWER FLUX LEVELS THIS WEEK, AND PROBABLY THROUGH THE REST OF THE MONTH. THIS WOULD HAVE LITTLE EFFECT ON THE MAJOR DX BANDS, BUT IT MAY SLOW DOWN DX ACTIVITY ON 50 MHZ, AND POSSIBLY 28 MHZ, ESPECIALLY IN THE LAST DAYS OF THE MONTH.

AMERICAN SUNSPOT NUMBERS FOR NOVEMBER 8 THROUGH 14 WERE 199, 156, 125, 98, 108, 110 AND 115 RESPECTIVELY, WITH A MEAN FIGURE OF 130.1. SOLAR FLUX NUMBERS AS REPORTED BY WWV FOR THE SAME TIME PERIOD WERE 212, 202, 193, 197, 194, 186 AND 201, WITH A MEAN FIGURE OF 198.

I wouldn't go so far as to call the advice BS, somewhat incomplete sure,
but he's on the right track.

>better. But the Yagi still is 20 ohms, and it
>could care less.

Ah, but the Yagi has only one driven element and no phasing harness. Most of the directional broadcast arrays that I've worked with use L networks at the base of each tower to match the tower to the 50 ohm phasing lines and to tune out the reactance caused by mutual coupling. Some of them also used 75 ohm line sections as their combiner.

If you don't feed the line at it's characteristic impedance, it will act as a transmission line transformer and really screw up your combiner and your phasor design. Of course some arrays I've seen used this fact to advantage in the design of the array, but those systems were really hard to keep balanced because they removed several of the adjustments available to compensate for changing ground conductivity with the change of the seasons. The really good array designs kept the lines matched unless they deliberately needed an impedance transformation as part of the combiner. Many of the combiners were adjustable lumped constant networks however.

The approach outlined by the original poster is sound for a two tower directional array with the addition of matching L networks at the base of each tower. Things get a lot hinckier if you have three or more towers and a complex pattern requirement. In those situations, your towers may need to be of different heights with special tuning requirements so that you can get the desired net RF currents to flow in them for the pattern required. I've even seen arrays with negative power readings in some of the towers. In fact this is quite common in five tower arrays. But you still want the coaxial lines matched in their characteristic impedances. More complex tuning networks are used at the tower bases to get the desired currents while still presenting a match to the lines.

Array design and tuning can be quite complex, but to say that one should ignore SWR in the phasing and combining lines is simply not true.

>One of the worst things that ever happened to ham
>radio is the invention of a cheap means of measuring
>SWR. Far too much attention is paid to it, mostly
>for the wrong reasons.

Any tool can be misused or misunderstood, but cheap SWR meters have been a boon to those using coax fed antenna systems. The old RF ammeter in the base of the tower is a good tool, and a vector phasemeter is very useful, but the good directional wattmeter is a more flexible tool if you understand what it is telling you and can read a tape measure and a Smith Chart.

Thank you for setting the record straight!

However, John IS concerned that Rusty will not be able to buy his dual bander, because he is way short of covering costs on the callsign project. I'm also concerned because if Rusty loses his dual bander, he sure isn't going to do the call sign project again!

So please - get in on the project (contact Rusty). If use use one of the callsign servers derived from his tapes, please send him a little contribution! Think of it as Shareware.

>RE:Updated Macintosh Ham Stacks (for HyperCard)

I was able to get mine via anonymous FTP from apple.com out of their pub/ham-radio directory. All five stacks are small enough to fit on an 800K floppy when compressed. If any one in the West Texas/New Mexico area that can't FTP wants a copy, give me a shout.

I try to keep other PD/Shareware Mac goodies as well.

Bye for now, 73

The text listed below comes form a flyer found in our local amateur electronics store in Honolulu. I have copied it as faithfully as

possible (mistakes included). Note that the dashed lines starting under the word "resistration" indicate that clause was underlined in the original. Also the word "not" in the sentence with "cram course" was in bold in the original, not caps as presented here.

@@@@@@@@@@@@@@@@@@@@@@ begin flyer text @@@@@@@@@@@@@@@@@@@@@@@@@@@@

HAM RADIO LICENSE COURSE
presented by
GORDON WEST WB6NOA
JANUARY 17, 19 & 20, 1991
HAWAII YACHT CLUB
OPEN TO ALL

- Pass the Novice-Voice Exam right in class!
- Over 20 hours of Beginner Theory & Code practice.
- No previous in background in Code or Theory required.
- Special marine and ham radio installation and operation seminar.

Class fee of $150 includes all course materials, consultation with Gordon regarding equipment selection and installation on board your boat, and lunches and refreshments. Pre-study materials will be provided ahead of time, so registration at least 30 days before the course is essential.

==-

Mariners may obtain the amateur radio Novice Class license in just one weekend. Current Novice privileges allow operation on the worldwide voice frequencies on the 10-meter band. Complete instruction in code and theory will be covered. The Novice Class license exam will be given by Volunteer Ham radio operators in the last hour of the course. Many ham radio and electronic demonstrations liven up the weekend and there are opportunities for "hands-on" experience.

This accelerated course is designed to help the student be a good begineer ham operator. This is NOT a cram course. Gordon West will thoroughly cover all FCC element 2 & 1A materials in his fun and humorous style. Multiple test availability assures passing the exam Sunday evening.

- Textbooks, tapes, code key and oscillator and numerous handouts are supplied free!
- Course fee is $150.

Pre-registration is a must and space is limited! Register NOW at
Hawaii Yacht Club, 1739C Ala Moana Blvd., Honolulu, HI 96815.
(808) 949-4622.

@@@@@@@@@@@@@@@@@@@@@@ end flyer text @@@@@@@@@@@@@@@@@@@@@@@@@@@@

I have been a licensed amateur since this summer. My wife just also passed her tech class license. We both studied and learned both the code and the knowledge required to honestly pass the required tests. The "assurance" offered by the above flyer upsets me beyond words. If such an offering is not illegal it certainly must be unethical.

```
I refuse to be convinced that this is proper and ask those who
feel my outrage to suggest a course of action.  To whom do I write
and what should be said?  This is now my hobby too, but I am young
in the teeth and seek your inputs.

I know what my license is worth to me.  Unfortunately, I also now
know what it costs.

         Best regards, Robert J. Hlivak  NH6XO

Subject: QRP on 20 meters
To: info-hams@ucsd.edu

Last night at 0620 UTC (8:20 pm local time) I worked JA1WVK, a 2 watt station on 20 meter SSB. He was using a TH7DX tribander, but I was still surprised at his signal strength, about S-2. On my end I'm using just a G5RV dipole (3/2 wave) at 100 feet, and 100 watts. I also tried reducing power, and he could hear me at the 1 watt level.

Naturally, after 5 minutes or so at QRP some LID came up practically on top of us so I had to increase power again... we tried 15 meters but no contact was made.

For the curious, Yoshi's rig was a Mizuho MX14S monoband transceiver. He had a similar monobander for 15 meters.

The moral of the story is: Even on DX alley of 20 meters you can run low power. It sure does help to have a good antenna! Of course, if we had been on 10 meters, the QSO would have been a lot longer.

This would require a 37.5 ohm quarterwave matching section. 37.5

ohm cable is not off-the-shelf at the local parts house. If instead, you use two 75 ohm matching sections before the combining junction, then two 100 ohm loads in parallel equal 50 ohms. CATV cable is off-the-shelf. Sometimes you need to check your design for what parts are commonly available.

I've often thought about this problem, and I keep running into the same question. How do you guarantee that the phase shifts through both matching networks are identical? As you said, the feed point impedances of the two antennas will probably not be the same, so even if you used a simple L-network for matching, the phase shifts would not be identical. Any significant difference in phase shifts will ruin the pattern of the array.

I wouldn't go so far as to call the advice BS, somewhat incomplete sure,
but he's on the right track.

>could care less.

Ah, but the Yagi has only one driven element and no phasing harness.
Most of the directional broadcast arrays that I've worked with use L
networks at the base of each tower to match the tower to the 50 ohm
phasing lines and to tune out the reactance caused by mutual coupling.
Some of them also used 75 ohm line sections as their combiner.

If you don't feed the line at it's characteristic impedance, it will
act as a transmission line transformer and really screw up your
combiner and your phasor design. Of course some arrays I've seen used
this fact to advantage in the design of the array, but those systems
were really hard to keep balanced because they removed several of the
adjustments available to compensate for changing ground conductivity
with the change of the seasons. The really good array designs kept the
lines matched unless they delibrately needed an impedance transformation
as part of the combiner. Many of the combiners were adjustable lumped
constant networks however.

The approach outlined by the original poster is sound for a two tower
directional array with the addition of matching L networks at the base
of each tower. Things get a lot hinckier if you have three or more towers
and a complex pattern requirement. In those situations, your towers may
need to be of different heights with special tuning requirements so that

you can get the desired net RF currents to flow in them for the pattern required. I've even seen arrays with negative power readings in some of the towers. In fact this is quite common in five tower arrays. But you still want the coaxial lines matched in their characteristic impedances. More complex tuning networks are used at the tower bases to get the desired currents while still presenting a match to the lines.

Array design and tuning can be quite complex, but to say that one should ignore SWR in the phasing and combining lines is simply not true.

>One of the worst things that ever happened to ham
>radio is the invention of a cheap means of measuring
>SWR. Far too much attention is paid to it, mostly
>for the wrong reasons.

Any tool can be misused or misunderstood, but cheap SWR meters have been a boon to those using coax fed antenna systems. The old RF ammeter in the base of the tower is a good tool, and a vector phasemeter is very useful, but the good directional wattmeter is a more flexible tool if you understand what it is telling you and can read a tape measure and a Smith Chart.

The text listed below comes form a flyer found in our local amateur electronics store in Honolulu. I have copied it as faithfully as possible (mistakes included). Note that the dashed lines starting under the word "resistration" indicate that clause was underlined in the original. Also the word "not" in the sentence with "cram course" was in bold in the original, not caps as presented here.

@@@@@@@@@@@@@@@@@@@@@@ begin flyer text @@@@@@@@@@@@@@@@@@@@@@@@@@@@

HAM RADIO LICENSE COURSE
presented by
GORDON WEST WB6NOA
JANUARY 17, 19 & 20, 1991
HAWAII YACHT CLUB
OPEN TO ALL

- Pass the Novice-Voice Exam right in class!
- Over 20 hours of Beginner Theory & Code practice.
- No previous in background in Code or Theory required.
- Special marine and ham radio installation and operation seminar.

Class fee of $150 includes all course materials, consultation with Gordon regarding equipment selection and installation on board your boat, and lunches and refreshments. Pre-study materials will be provided ahead of time, so registration at least 30 days before the course is essential.

==-

Mariners may obtain the amateur radio Novice Class license in just one weekend. Current Novice privileges allow operation on the worldwide voice frequencies on the 10-meter band. Complete instruction in code and theory will be covered. The Novice Class license exam will be given by Volunteer Ham radio operators in the last hour of the course. Many ham radio and electronic demonstrations liven up the weekend and there are opportunities for "hands-on" experience.

This accelerated course is designed to help the student be a good begineer ham operator. This is NOT a cram course. Gordon West will thoroughly cover all FCC element 2 & 1A materials in his fun and humorous style. Multiple test availability assures passing the exam Sunday evening.

- Textbooks, tapes, code key and oscillator and numerous handouts are supplied free!
- Course fee is $150.

Pre-registration is a must and space is limited! Register NOW at
Hawaii Yacht Club, 1739C Ala Moana Blvd., Honolulu, HI 96815.
(808) 949-4622.

@@@@@@@@@@@@@@@@@@@@@@ end flyer text @@@@@@@@@@@@@@@@@@@@@@@@@@@@

I have been a licensed amateur since this summer. My wife just also passed her tech class license. We both studied and learned both the code and the knowledge required to honestly pass the required tests. The "assurance" offered by the above flyer upsets me beyond words. If such an offering is not illegal it certainly must be unethical. I refuse to be convinced that this is proper and ask those who feel my outrage to suggest a course of action. To whom do I write and what should be said? This is now my hobby too, but I am young in the teeth and seek your inputs.

I know what my license is worth to me. Unfortunately, I also now know what it costs.

Best regards, Robert J. Hlivak NH6XO

Subject: QRP on 20 meters
To: info-hams@ucsd.edu

Last night at 0620 UTC (8:20 pm local time) I worked JA1WVK,
a 2 watt station on 20 meter SSB. He was using a TH7DX tribander,
but I was still surprised at his signal strength, about S-2. On
my end I'm using just a G5RV dipole (3/2 wave) at 100 feet, and 100 watts.
I also tried reducing power, and he could hear me at the 1 watt level.

Naturally, after 5 minutes or so at QRP some LID came up practically
on top of us so I had to increase power again... we tried 15 meters but
no contact was made.

For the curious, Yoshi's rig was a Mizuho MX14S monoband transceiver.
He had a similar monobander for 15 meters.

The moral of the story is: Even on DX alley of 20 meters you can run low power. It sure does help to have a good antenna! Of course, if we had been on 10 meters, the QSO would have been a lot longer.

>network. Each antenna should now have the same power being
>radiated, so the cardiod pattern should be correct.

This would require a 37.5 ohm quarterwave matching section. 37.5 ohm cable is not off-the-shelf at the local parts house. If instead, you use two 75 ohm matching sections before the combining junction, then two 100 ohm loads in parallel equal 50 ohms. CATV cable is off-the-shelf. Sometimes you need to check your design for what parts are commonly available.

I've often thought about this problem, and I keep running into the

same question. How do you guarantee that the phase shifts through
both matching networks are identical? As you said, the feed point
impedances of the two antennas will probably not be the same, so even
if you used a simple L-network for matching, the phase shifts would
not be identical. Any significant difference in phase shifts will
ruin the pattern of the array.

Subject: Updated Macintosh Ham Stacks (for HyperCard) now available
To: info-hams@ucsd.edu

pbhx@midway.uchicago.edu (Peter B. Hayward) writes:

>I wish there was some way the Mac-based ham community could truly reward
>Diana for these stacks. I used her earlier sets to go from nothing to Extra
>in just over a year. Of course, I read the books, but the ability to have
>hypercard test me over and over again helped me realize where I needed more
>studying (and helped me with the famous exam nerves syndrome.)

Early in 1990, I set out to complete my New Year's resolution of obtaining my novice and tech license. I went about 2/3 of the way through a class taught by the Stanford amateur radio club, but never took the test. Then a little over a week ago, I found the HyperCard stacks on apple.com (ftp), and decided to go for it once again. I had forgotten almost all of the code I learned at Stanford, but with the Mac "Morse" program, and the HyperCard stacks, I really studied intensely for five days (though my four years studying Electrical Engineering did help too), and last Sunday I took the Novice written test (missed two questions), and the Tech written test (perfect score) and the code test (perfect score). Sure was a hell of a lot easier with the Mac rather than reading the boring books...

>So, Diana, for all of us: Thanks so much!!!

I second that whole-heartedly! One minor thing: The stacks I have don't have any version number (I retrieved them a few weeks ago from apple.com) in them, but they did seem to have some problems occassionally - they would stop in the middle of a test and tell me (on the summary page) that I had missed all of the remaining questions. Strange. Oh well, I passed anyway!

SB RTTYDX @ RTTYDX $RTDX1123
RTTY DX Notes 1of3 11/23/90

RTTY DX Notes for week ending 23rd November 1990
BID: $RTDX1123
Part 1 of 3.

One wonders where the art of communications has gone to? Over the past week I have been looking at the mini mailboxes. I Saw 43 of them. Are they all small sized PK232s? It seems that with the proliferation of these units it will soon be impossible to find a space to have a QSO. I think that an original idea that was put forward would be a viable answer. All mailboxes (including mini mailboxes) be shifted to 10 and 18 MHz. That would be a logical answer. Use those frequencies, or lose them.

Our thanks this week go to DJ3IW and the Saar-Pfalz-DX-Club Packet Cluster, I5FLN, I5ICY, I5IGQ, JA1BLV, N2HOS, OD5NG, TG9VT, VK2EG, W2JGR and the Tri-State DX Packet Cluster Network. Thank you all for your very welcome information and help.

RTTY DX Notes 3of3 11/23/90

RTTY DX Notes for week ending 23rd November 1990
BID: $RTDX1123B
Part 3 of 3.

QSL Information:

UC2OCJ says to QSL via Box 68, Gomel. 246027 Buelrussia, USSR.

9X5LJ and 9X5AB request their cards be sent to Box 81, Kigali, Rwanda.

UH8EA collects his cards from W5BWA.

5N0ETP collects his cards via N6LQL.

9Q5TE has SM0BFJ as his QSL manager.

CE0ZZZ says to QSL to Box 13312 Santiago, Chile.

Notes of Interest:

JA3DLE/1 reports that JG1RVN will be QRV from XU for 6 days from 3rd to 9th December with lots of RTTY.

On 27th November, or around that date, (after the CW contest), N7NG, OH2BH, OH2RF, and ZS6BCR will operate from Penguin Island (off the coast of Namibia) for 6 days by special permission of the South African Nature and Conservation people. The callsign could be ZS9Z/ZS1, after which they will operate from Walvis Bay with the callsign of ZS9Z for 4 days. They will use Icom gear and the QSLS go to OH2BH.

3W3RR is still hopeful of operating from Spratley in December.

Kure Island (KH7) is scheduled for December 12-21, all bands including 6 meters, if they can find some gear and aerials for 6. If you can help, call 671-346-2201 (in Guam) after 0600Z. Prefixes may be KH7/AH7/WH7 for the prefix hunters. The basic callsign will be KD7P/NH7.

SP5FYM is headed for King George Island (Antarctica) for January 1991.

There is a plan to activate 'MV' Island (in the Gulf of Finland) in March 1991. They require RTTY gear. More later.

GL DE DX1 (VK2SG).

Written by VK2SG. Relayed via packet by Tad, KT7H @ N7HFZ.WA.USA.NA.
Send RTTY DX tips to VK2SG @ VK2AGE.AUS.AU.

Are you reading this from a packet BBS in Utah, Colorado, Kansas, Missouri, Kentucky, Tennessee or Georgia? Send a message noting the station originating this bulletin to KT7H @ N7HFZ.WA.USA.NA.

RE:AMSAT ELEMENT SETS

GREETINGS ALL,

I have been wondering WHY the good people at AMSAT insists on publishing orbital element data in an archaic and expanded format. I have been relaying AMSAT BN's from KT7H @ N7HFZ.WA.USA.NA for a few months. I do not understand the logic of sending data that takes up twice the space and requires manual input to be used. I also copy the data posted by T.S. Kelso and send out the orbital data on the local VHF Packet network. I have compared the size of the two formats and it's close to a two to one ratio with the same data in different formats. AMSAT BN's sent:

```
Satellite: AO-10
Catalog number: 14129
Epoch time:      90311.38885312
Element set:     621
Inclination:       26.0154 deg
RA of node:       176.3254 deg
Eccentricity:    0.5958797
Arg of perigee:   190.4011 deg
Mean anomaly:     147.4868 deg
Mean motion:    2.05880027 rev/day
Decay rate:       1.30e-07 rev/day^2
Epoch rev:            2768
```

T.S. Kelso sent the following:

```
OSCAR 10
1 14129U 83 58  B 90311.38885312  .00000013  00000-0  00000 0 0  6218
2 14129  26.0154 176.3254 5958797 190.4011 147.4868  2.05880027 27684
```

It's the same data only in half the space. Is there any one that reads this net that knows who to talk to to fix this problem? I see this expanded format floating through the BBS's on packet taking up space. I could cut and paste the short data into the AMSAT BN's if I can't get AMSAT to change. Nobody locally uses the expanded stuff. Any one with a better idea on how to handle this problem post or e-mail me.

Bye for now, 73
DE LARRY,
e mail--> LSPRINGSTEEN @ WSMR-SIMTEL20.ARMY.MIL

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.
